Federated Infrastructures

Read our State of Play paper soon – link coming up. Selected preliminary conclusions:

- Low-hanging fruit: interoperable Authentication (and possibly Authorisation): AAI
- Common need for Federated Storage; bonus here:
- What's most easy to federate (bytes as opposed to structured and model data) is also the most useful to federate
- Funding models are generally not up to cross-project, let alone cross-disciplinary infrastructures
- Some disciplines have existing strengths in storage, some in computing, some archive use: Let's learn from each other!
