The Belle II Collaboration decided on DEPFET as baseline for the pixel detector

Belle II PXD

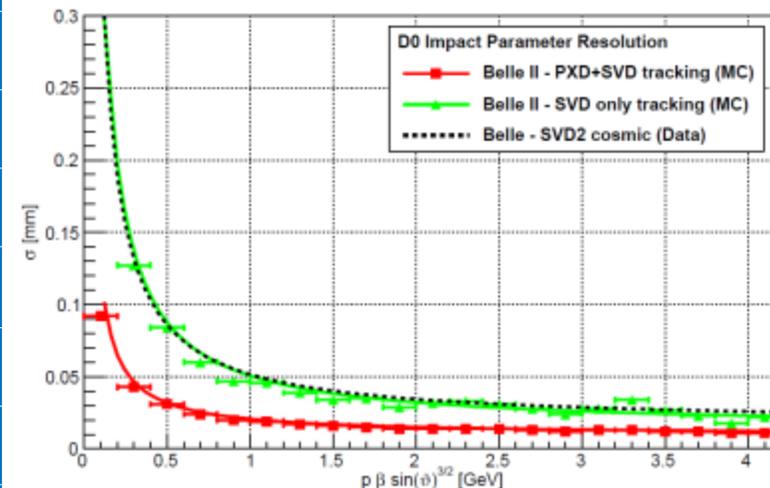

ILD 5-layer VXD

	Belle II	ILD LOI 5-layer layout	
Radii	14, 22	15, 26, 38, 49, 60	mm
Ladder length	90 (L1), 122 (L2)	123 (L1), 250 (L2-L5)	mm
Sensitive width	12.5 (L1-L2)	13 (L1), 22 (L2-L5)	mm
Number of ladders	8, 12	8, 8, 12, 16, 20	
Pixel size	50x50 (L1), 50x75 (L2)	25x25 (L1-L5)	μm^2
Frame rate	50	20 (L1), 4 (L2-L5)	kHz

The Belle II PXD DEPFET ladders: *almost* prototypes for L1 and L2 of ILD

	Belle II
Occupancy	0.4 hits/ $\mu\text{m}^2/\text{s}$
Radiation	2 Mrad/year
	$2 \cdot 10^{12}$ 1 MeV n_{eq} per year
Duty cycle	1
Frame time	20 μs
Momentum range	Low momentum (< 1 GeV)
Acceptance	17° - 155°
Material budget	0.21% X_0 per layer
Resolution	15 μm ($50 \times 75 \mu\text{m}^2$)

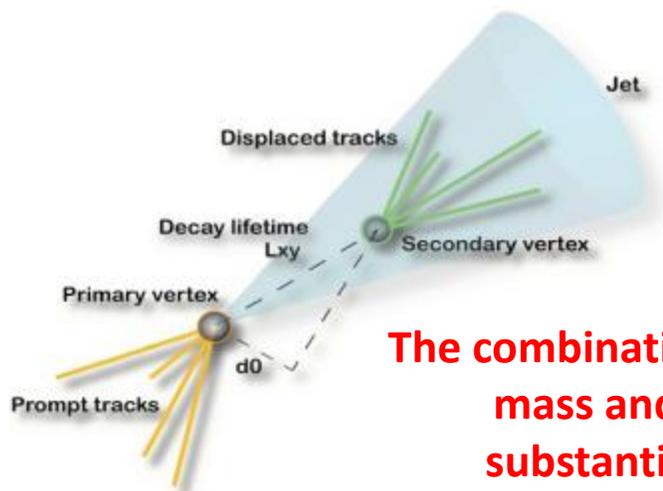

- Modest resolution (15 μm), dominated by multiple scattering \rightarrow Pixel size ($50 \times 75 \mu\text{m}^2$)
- Lowest possible material budget (0.2% X_0 /layer)
 - Ultra-transparent detectors
 - Lightweight mechanics and minimal services

	Belle II	ILC
Occupancy	0.4 hits/ $\mu\text{m}^2/\text{s}$	0.13 hits/ $\mu\text{m}^2/\text{s}$
Radiation	2 Mrad/year	< 100 krad/year
	$2 \cdot 10^{12}$ 1 MeV n_{eq} per year	10^{11} 1 MeV n_{eq} per year
Duty cycle	1	1/200
Frame time	20 μs	25-100 μs
Momentum range	Low momentum (< 1 GeV)	All momenta
Acceptance	17° - 155°	6° - 174°
Material budget	0.21% X_0 per layer	0.12% X_0 per layer
Resolution	15 μm (50x75 μm^2)	5 μm (20x20 μm^2)

- Excellent resolution (5 μm) \rightarrow Pixel size (20 x 20 μm^2)
- Lowest possible material budget (0.1% X_0 /layer)
 - Ultra-transparent detectors
 - Lightweight mechanics and minimal services

\rightarrow Both detectors have very similar requirements

The combination of resolution, mass and power is a substantial challenge

$$\sigma_{d0} \approx \sqrt{\frac{r_2^2 \sigma_1^2 + r_1^2 \sigma_2^2}{(r_2 - r_1)^2}} \oplus \frac{r}{p \sin^{\frac{3}{2}} \theta} 13.6 \text{ MeV} \sqrt{\frac{x}{X_0}}$$

$$\sigma_{d0} \approx a \oplus \frac{b}{p \sin^{\frac{3}{2}} \theta}$$

▪ Common vertex detector requirements

- First layer close to the IP
- Low material budget
 - Reduced services
 - Low power dissipation
- High granularity
 - Good spatial resolution
- Fast readout
- Radiation hardness

	a (μm)	b (μm GeV)
LHC	12	70
STAR	12	19
Belle II	8.5	10
ILC	5	10

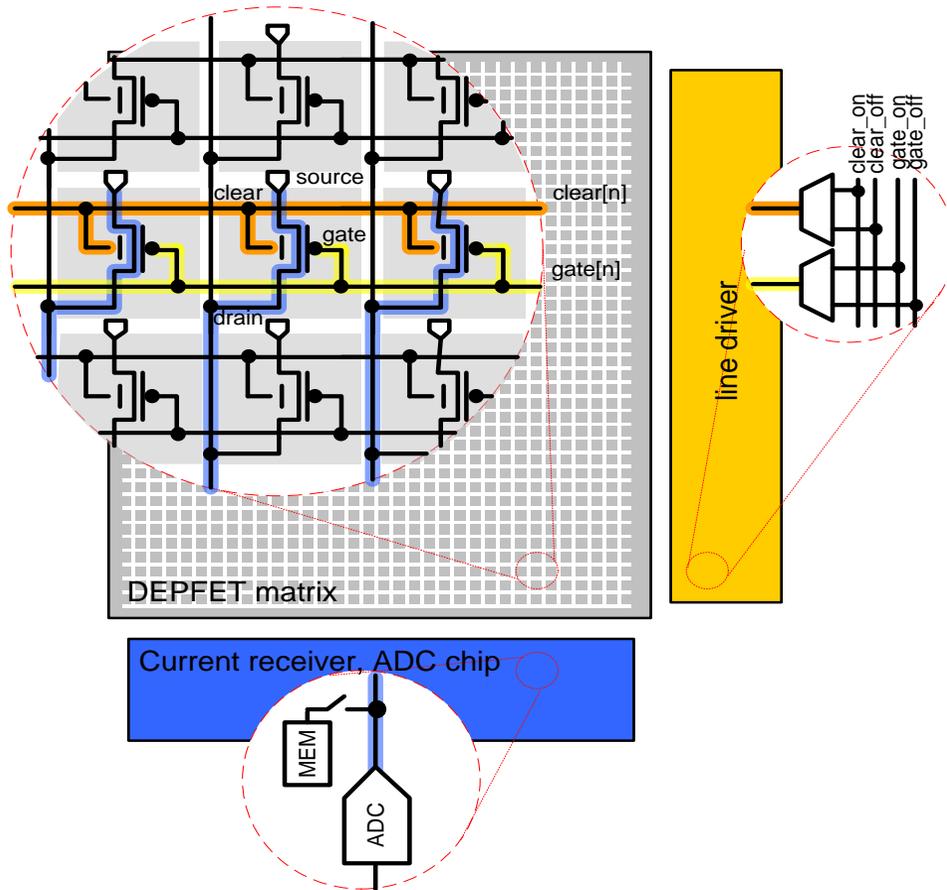

a: Governs high momentum
b: Dominates at low momentum

- Each pixel is a p-channel FET on a completely depleted bulk.
- A deep n-implant creates a potential minimum for electrons under the gate (internal gate)
- Signal electrons in the internal gate modulate the transistor current

$$g_q = \frac{\partial I_d}{\partial q} \propto \left(\frac{I_d}{L^3 W C_{ox}} \right)^{1/2} \sim 500 \text{ pA}/e^-$$

- Detection and internal amplification
- Small intrinsic noise
- Low power consumption

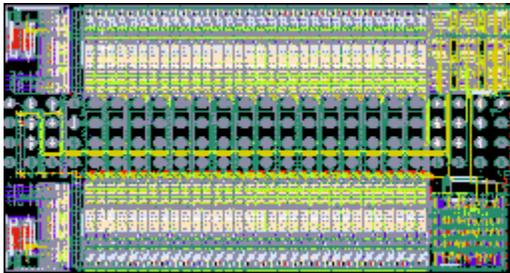

- Pixels are arranged in a matrix
- Row wise readout (4 rows at a time)
- Gate, clear lines need Switcher steering chip
- Long drain readout lines to keep material out of the acceptance region
- Only 'activated' rows consume power
 - The others are still sensitive to charge
 - Low power consumption

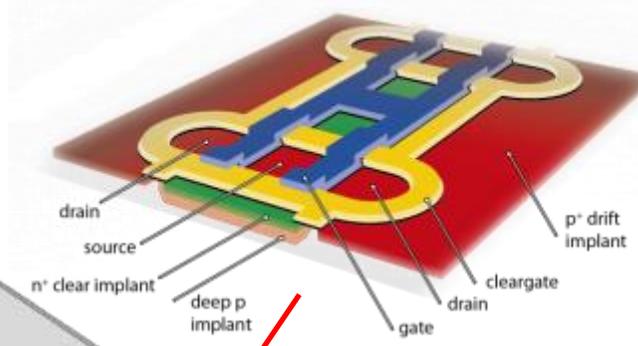

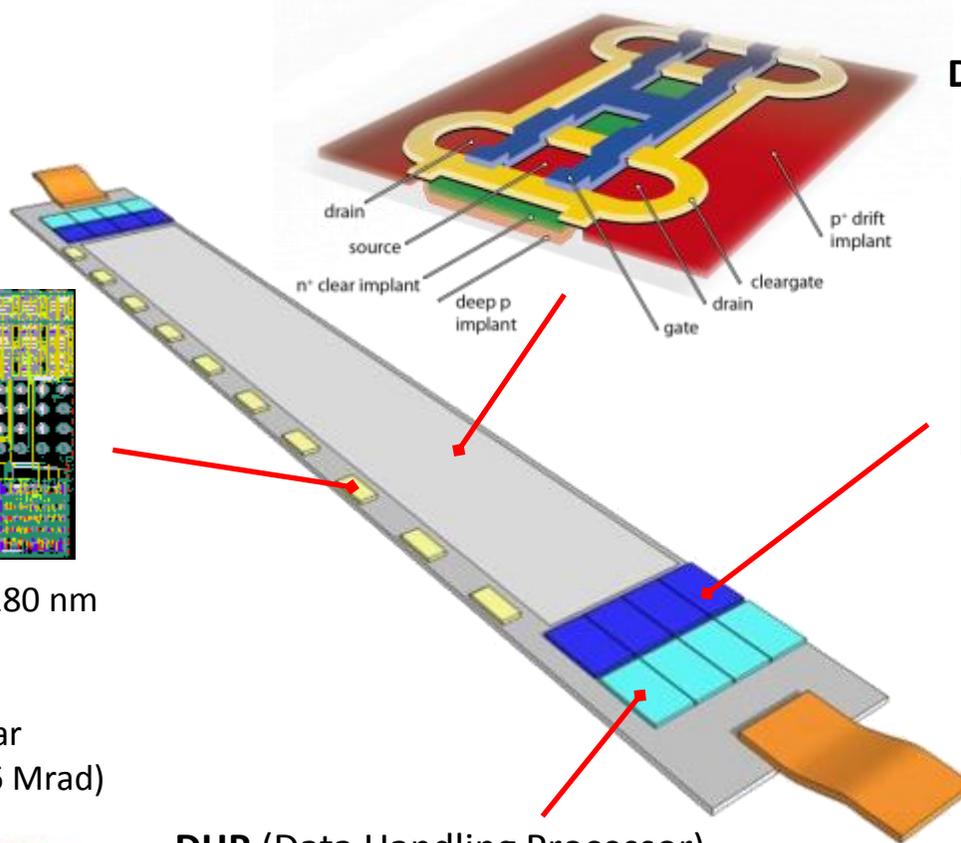

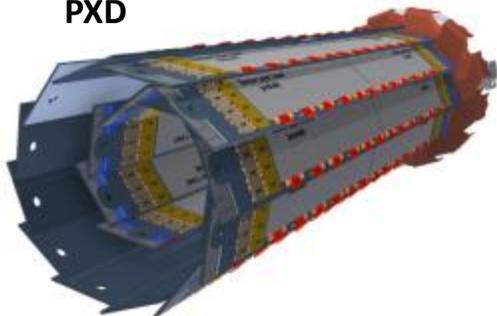

SwitcherB

Row control

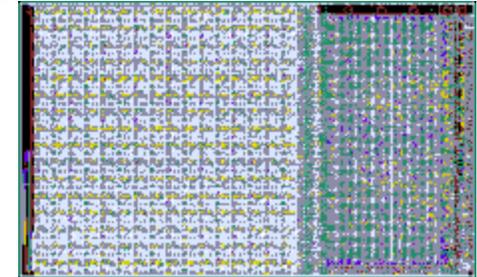

AMS/IBM HVCMOS 180 nm
 Size $3.6 \times 1.5 \text{ mm}^2$
 Gate and Clear signal
 Fast HV ramp for Clear
 Rad. Hard proved (36 Mrad)

PXD

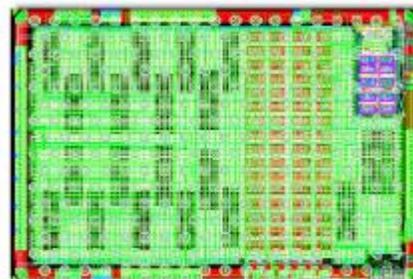

DCDB (Drain Current Digitizer) Analog frontend

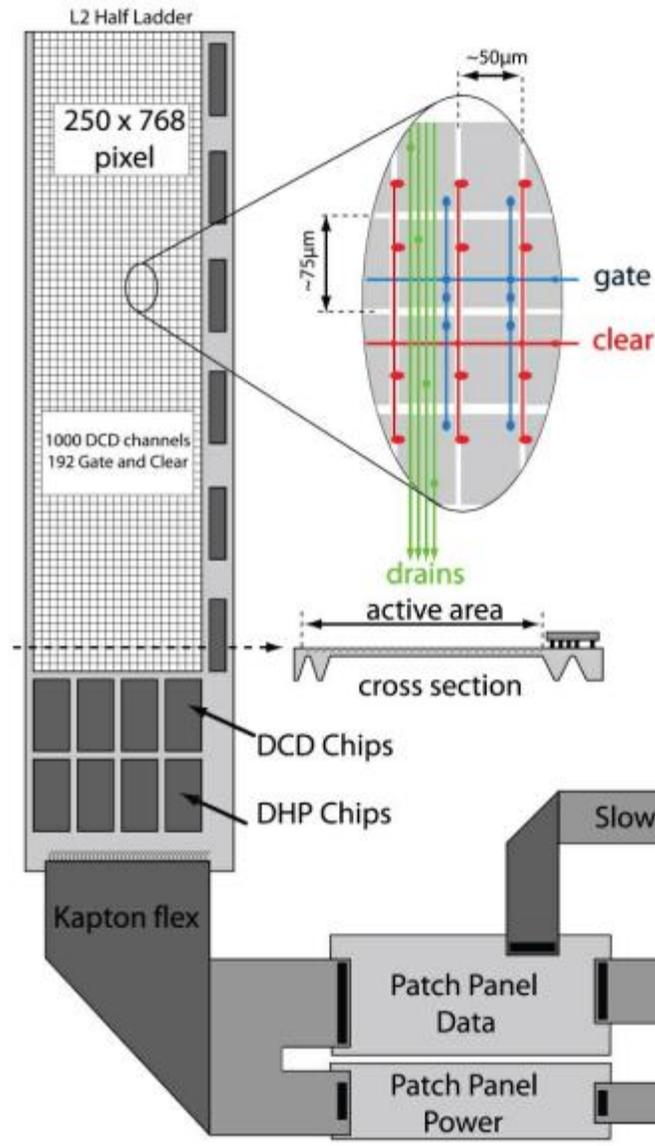

UMC 180 nm
 Size $5.0 \times 3.2 \text{ mm}^2$
 TIA and ADC
 Pedestal compensation
 Rad. Hard proved (20 Mrad)

DHP (Data Handling Processor) First data compression

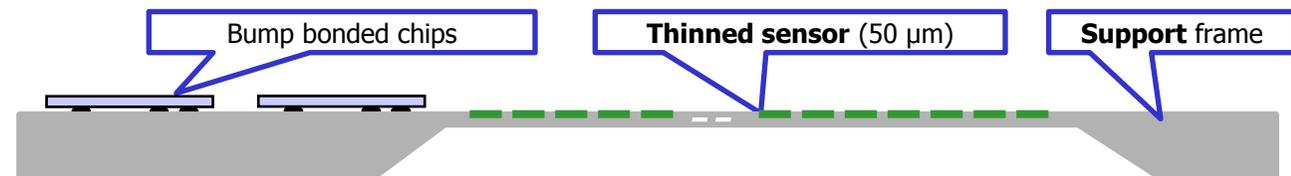

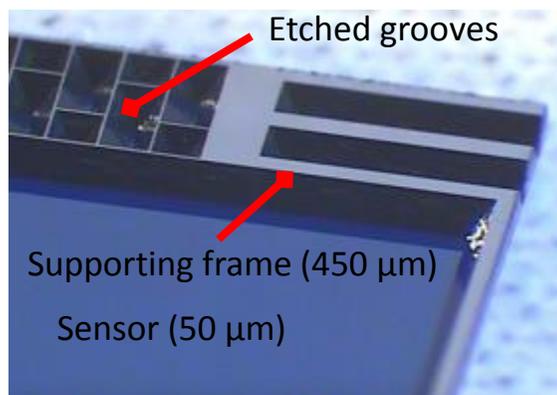

TSMC 65 nm
 Size $4.0 \times 3.2 \text{ mm}^2$
 Stores raw data and pedestals
 Common mode and pedestal correction
 Data reduction (zero suppression)
 Timing signal generation
 Rad. Hard proved (100 Mrad)

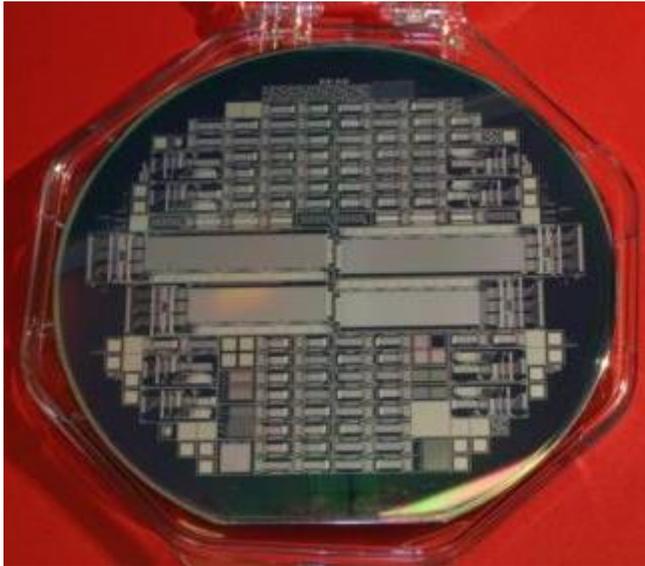

- **DHH** (Data Handling Hybrid)
Electrical - optical interface
Slow control master (JTAG)
Clustering
- **ONSEN**
Data buffer
Reduction via ROI selection (DATCON, HLT)

Use anisotropic etching on bonded wafers to create a thin, self-supporting sensor

- One material: uniform and small thermal expansion
- The DEPFET thickness is a free adjustable parameter

- 8 SOI wafers with 50 μm thin sensors (450 μm handle)
- Small test matrices with design variations
 - Full size sensors for prototyping

90 steps fabrication process:

9 Implantations

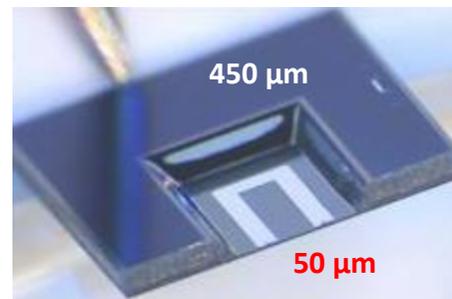

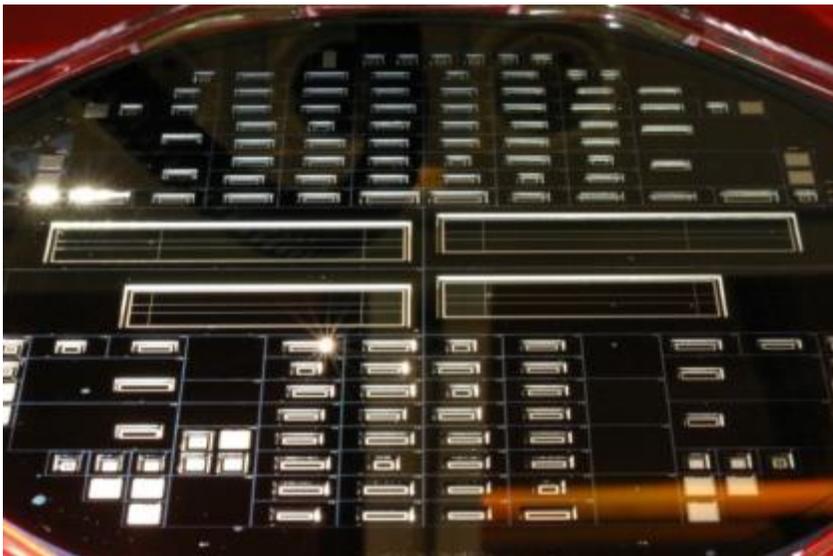

19 Lithographies

2 Poly-layers

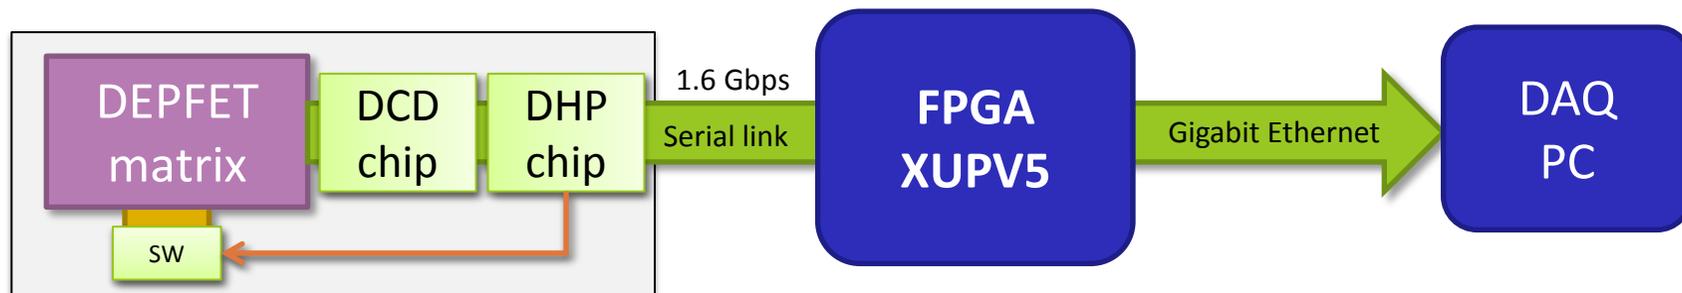

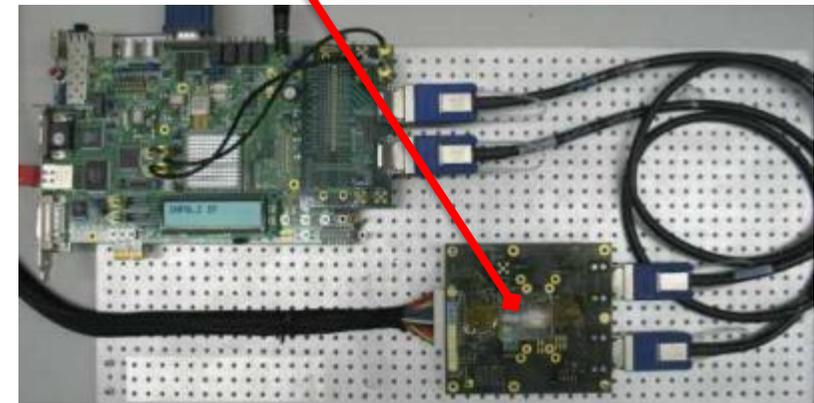

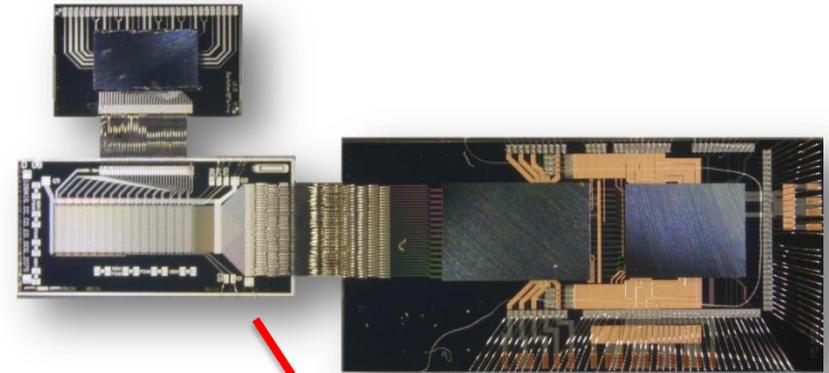

2 Alu-layers

1 Copper layer

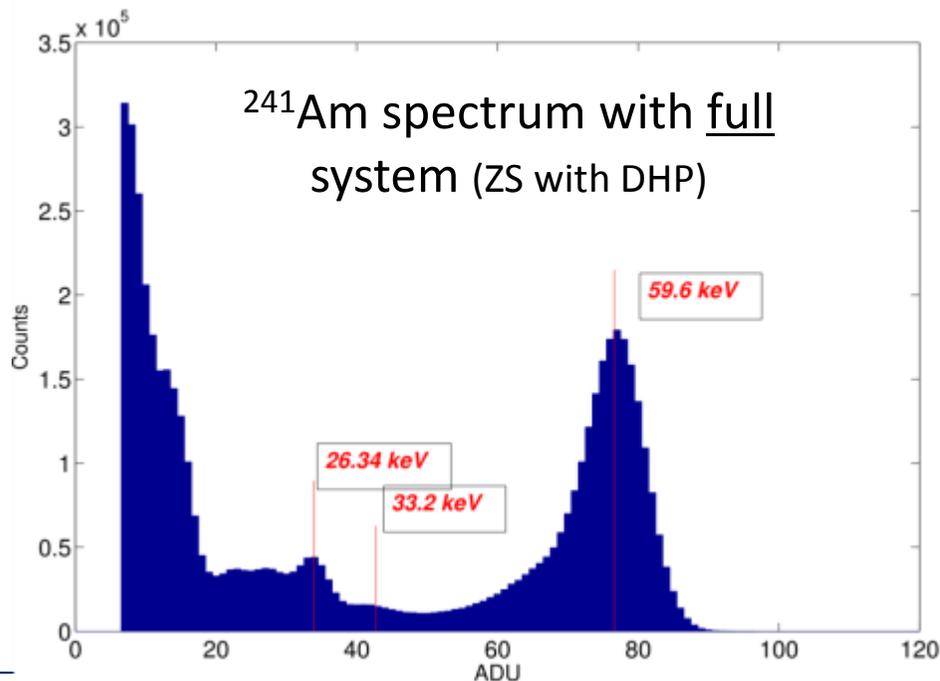

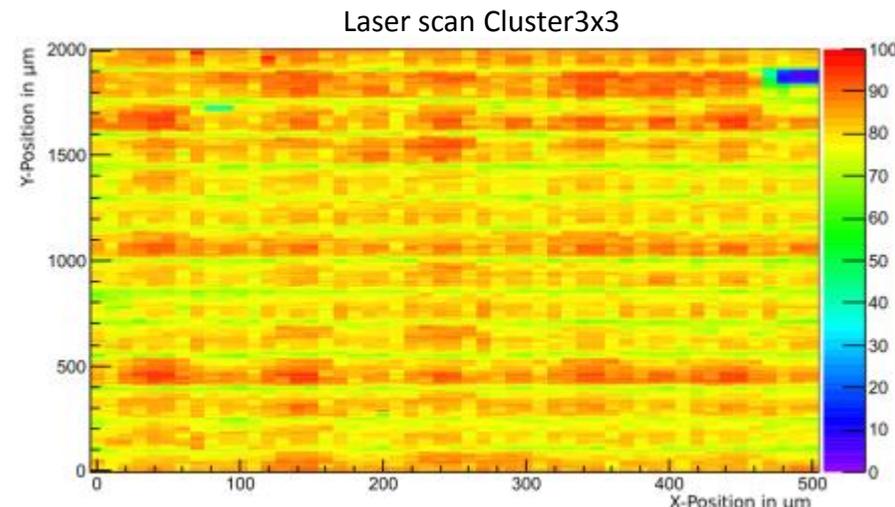

Back side processing

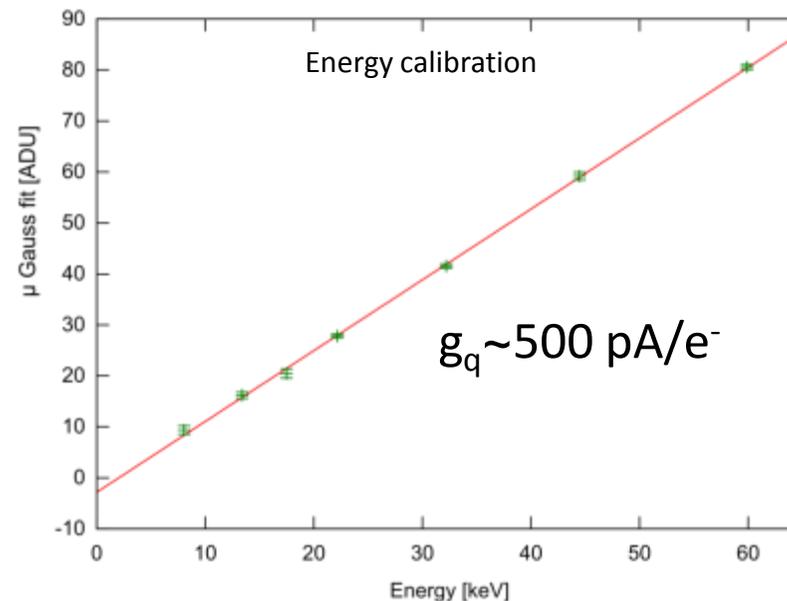

- Zero suppressed readout with the minimum necessary amount of components:
 - One Switcher-B
 - One DCDBv2
 - One DHP 0.2
 - Small thin matrix: Belle II SD PXD6 type, 16x128 pixels, $50 \times 75 \mu\text{m}^2$ pitch

- Biasing optimization (HV, ClearGate, Drift)
- Laser scan
Charge collection homogeneity
In pixel studies
- Radioactive source
System calibration

Homogeneous charge collection

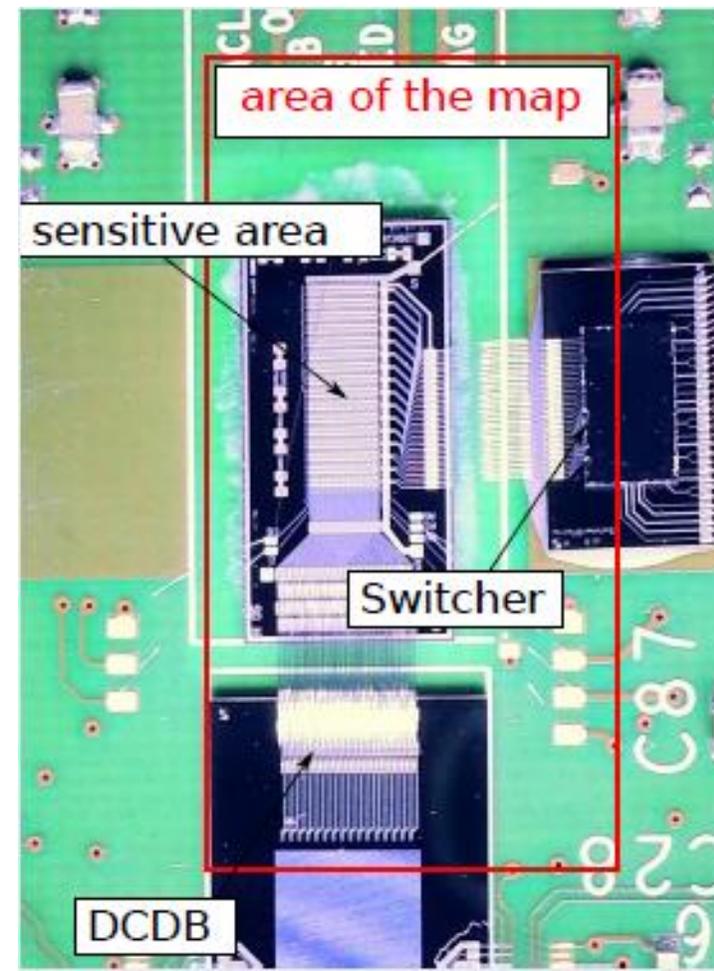

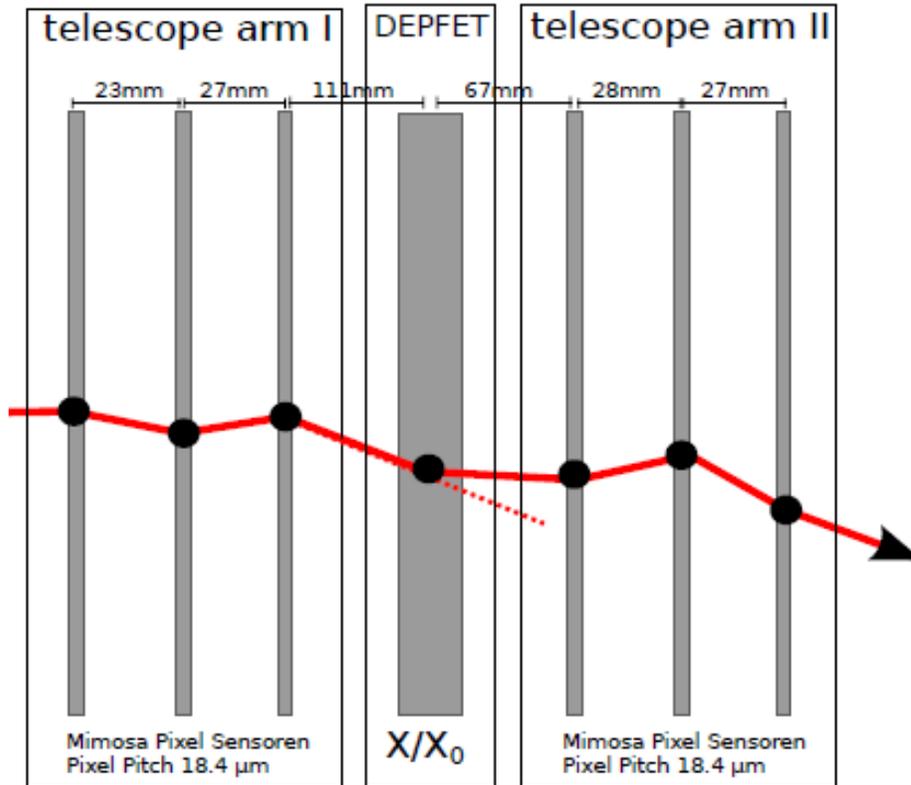

Beam Tests

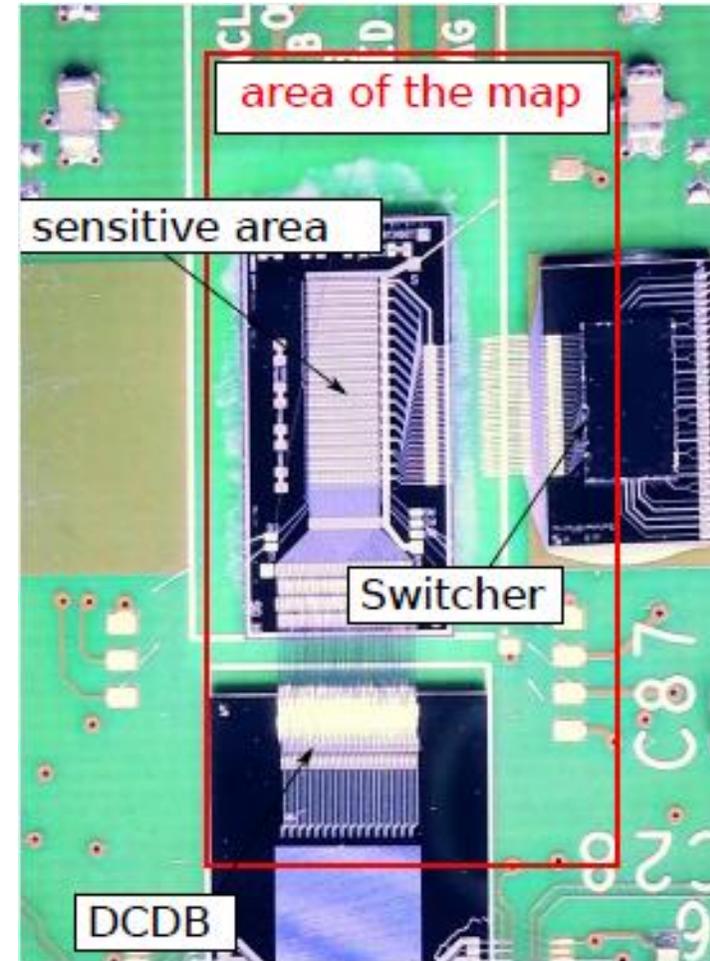

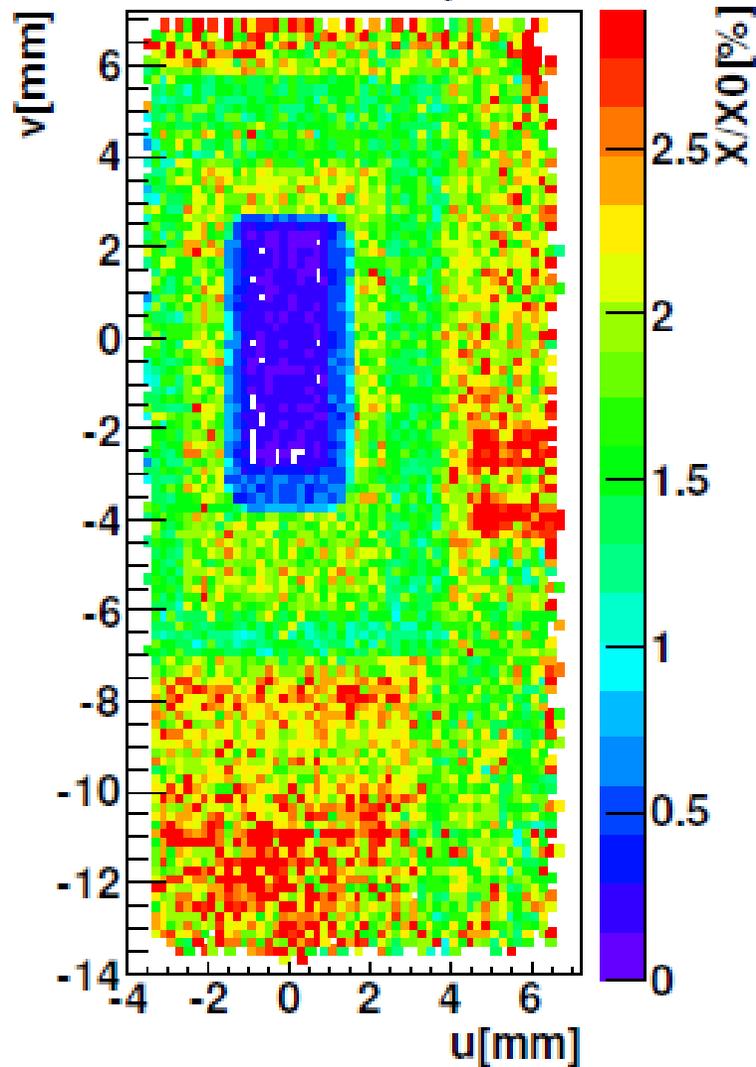

- **DEPFET PXD6 extensively tested over the last campaigns**
120 GeV pions at CERN-SPS
1-5 GeV electrons at DESY
Magnetic field
- **Sensor properties**
Charge collection homogeneity, operating points, efficiency, angular scans
Various pixel sizes, gate lengths, clear structures, drift regions and pixel designs
- **System related aspects**
Power supply prototypes
DHH and ONSEN readout

Here, just an appetizer

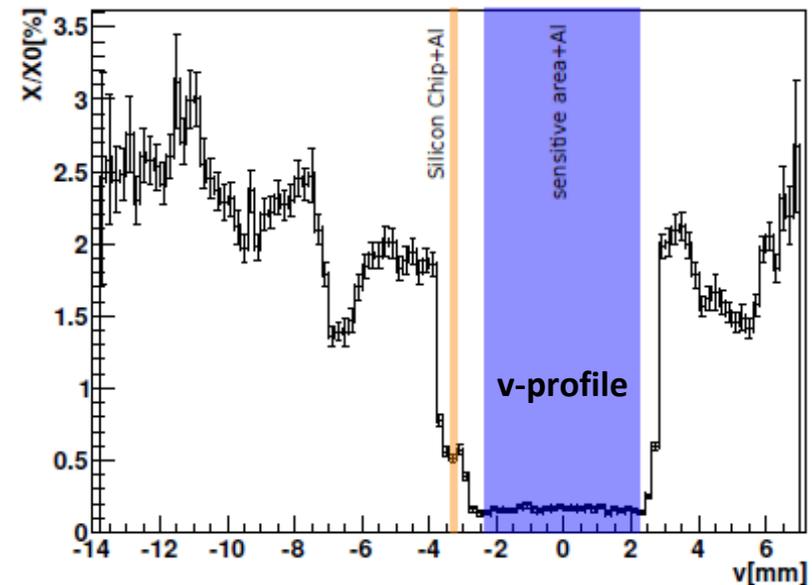

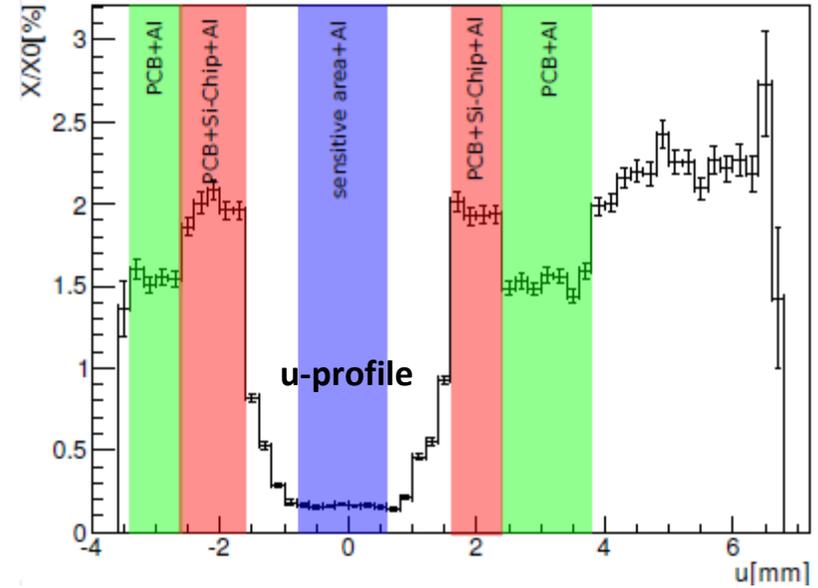

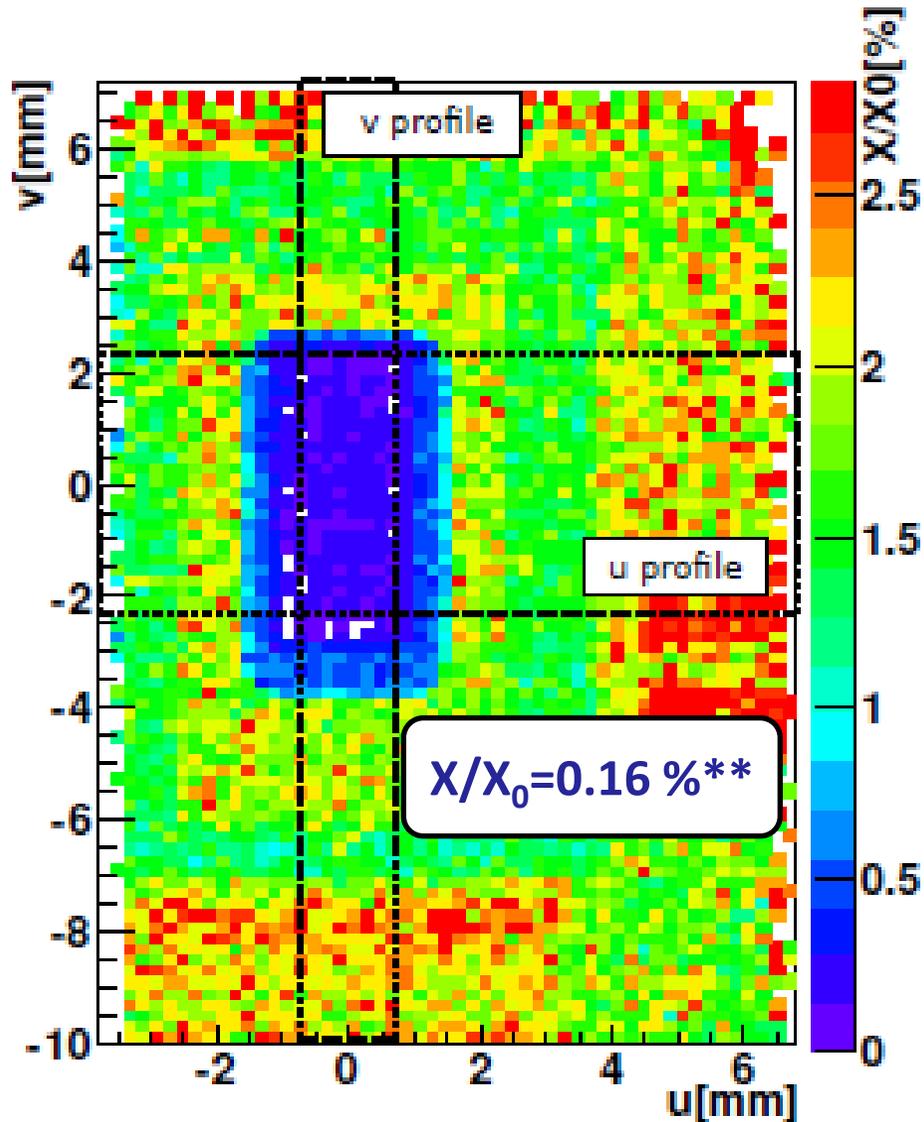

X/X₀ Map Using Tracks

Use tracks from the telescope to reconstruct angle distributions from multiple Coulomb scattering on a central plane

Material Budget Measurement

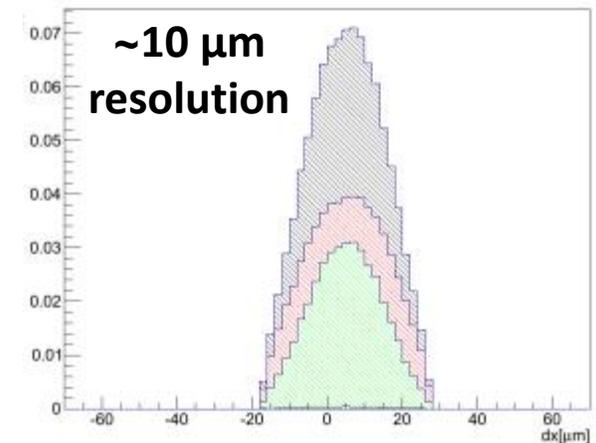

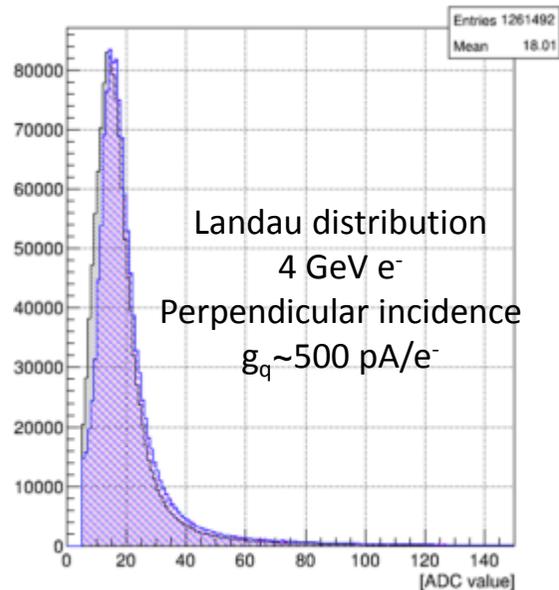

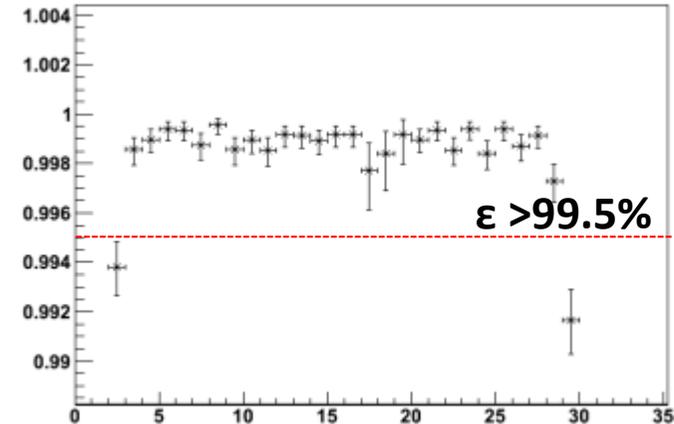

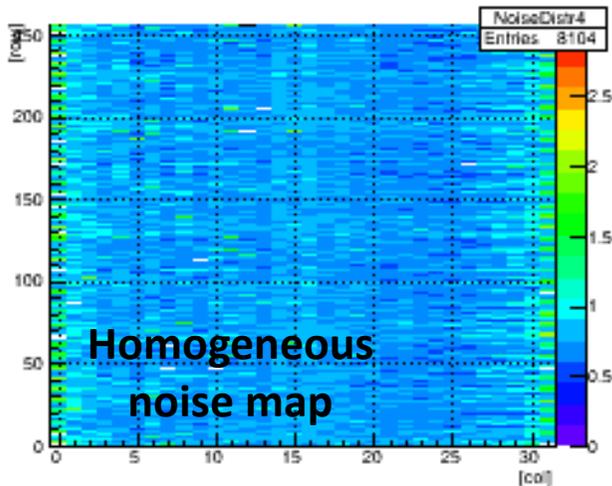

** Including (2x) Al windows

PXD6 Belle II design

Thin 50 μm sensor

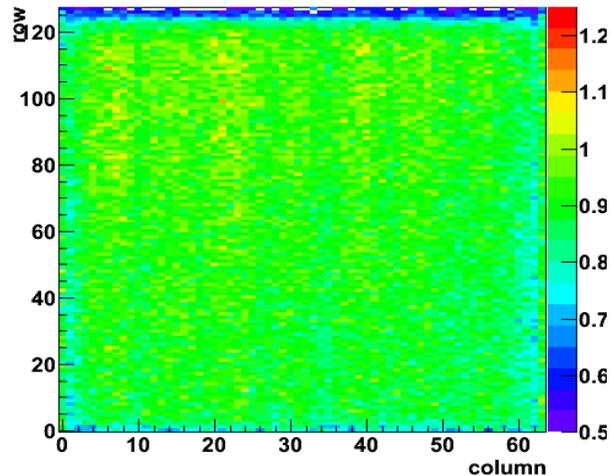

Pitch 50x75 μm^2

Targeted speed readout

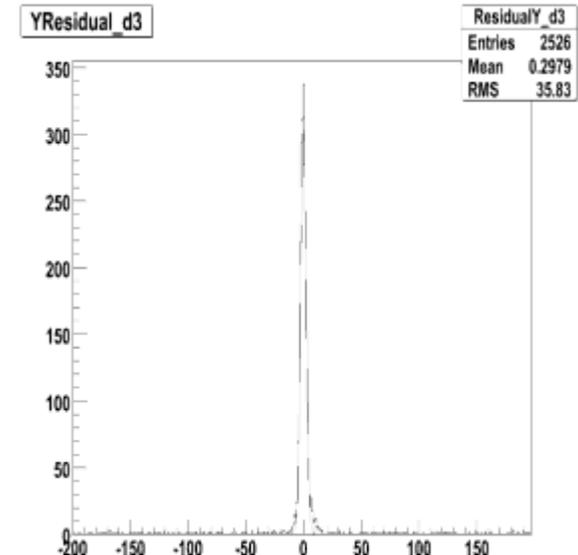

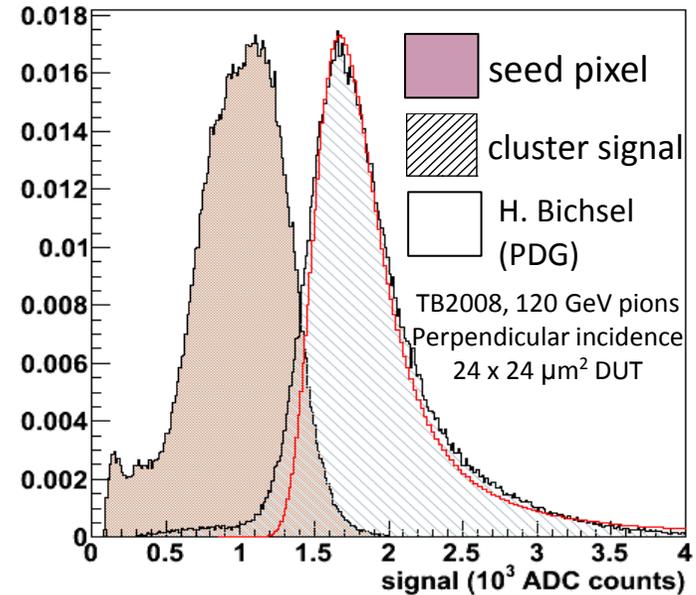

Prove of principle demonstrated in many test beam campaigns over the past years

Gain map: Deviation from average seed signal

- 64x128, 24x24x450 μm^3 CCG, 6 μm (TB2008)
 $g_q = 363 \text{ pA/e}^-$
- 64x256, 20x20x450 μm^3 CCG, 5 μm (TB2009)
 $g_q \sim 650 \text{ pA/e}^-$
- Resolution $\sigma \sim 1 \mu\text{m}$, 20x20x450 μm^3 , analog readout with charge interpolation

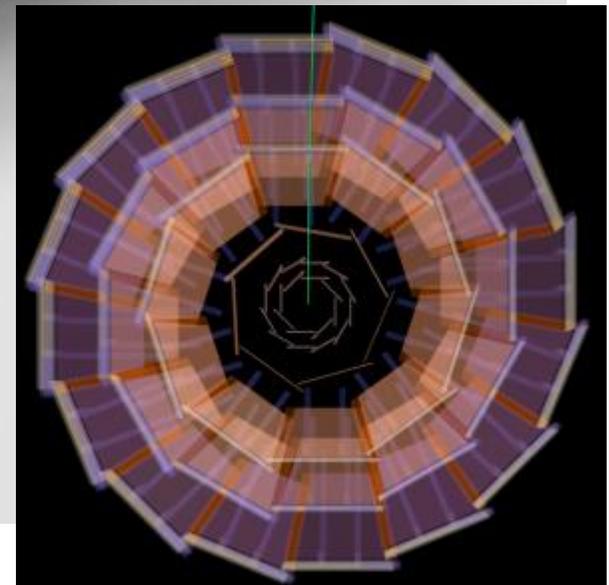

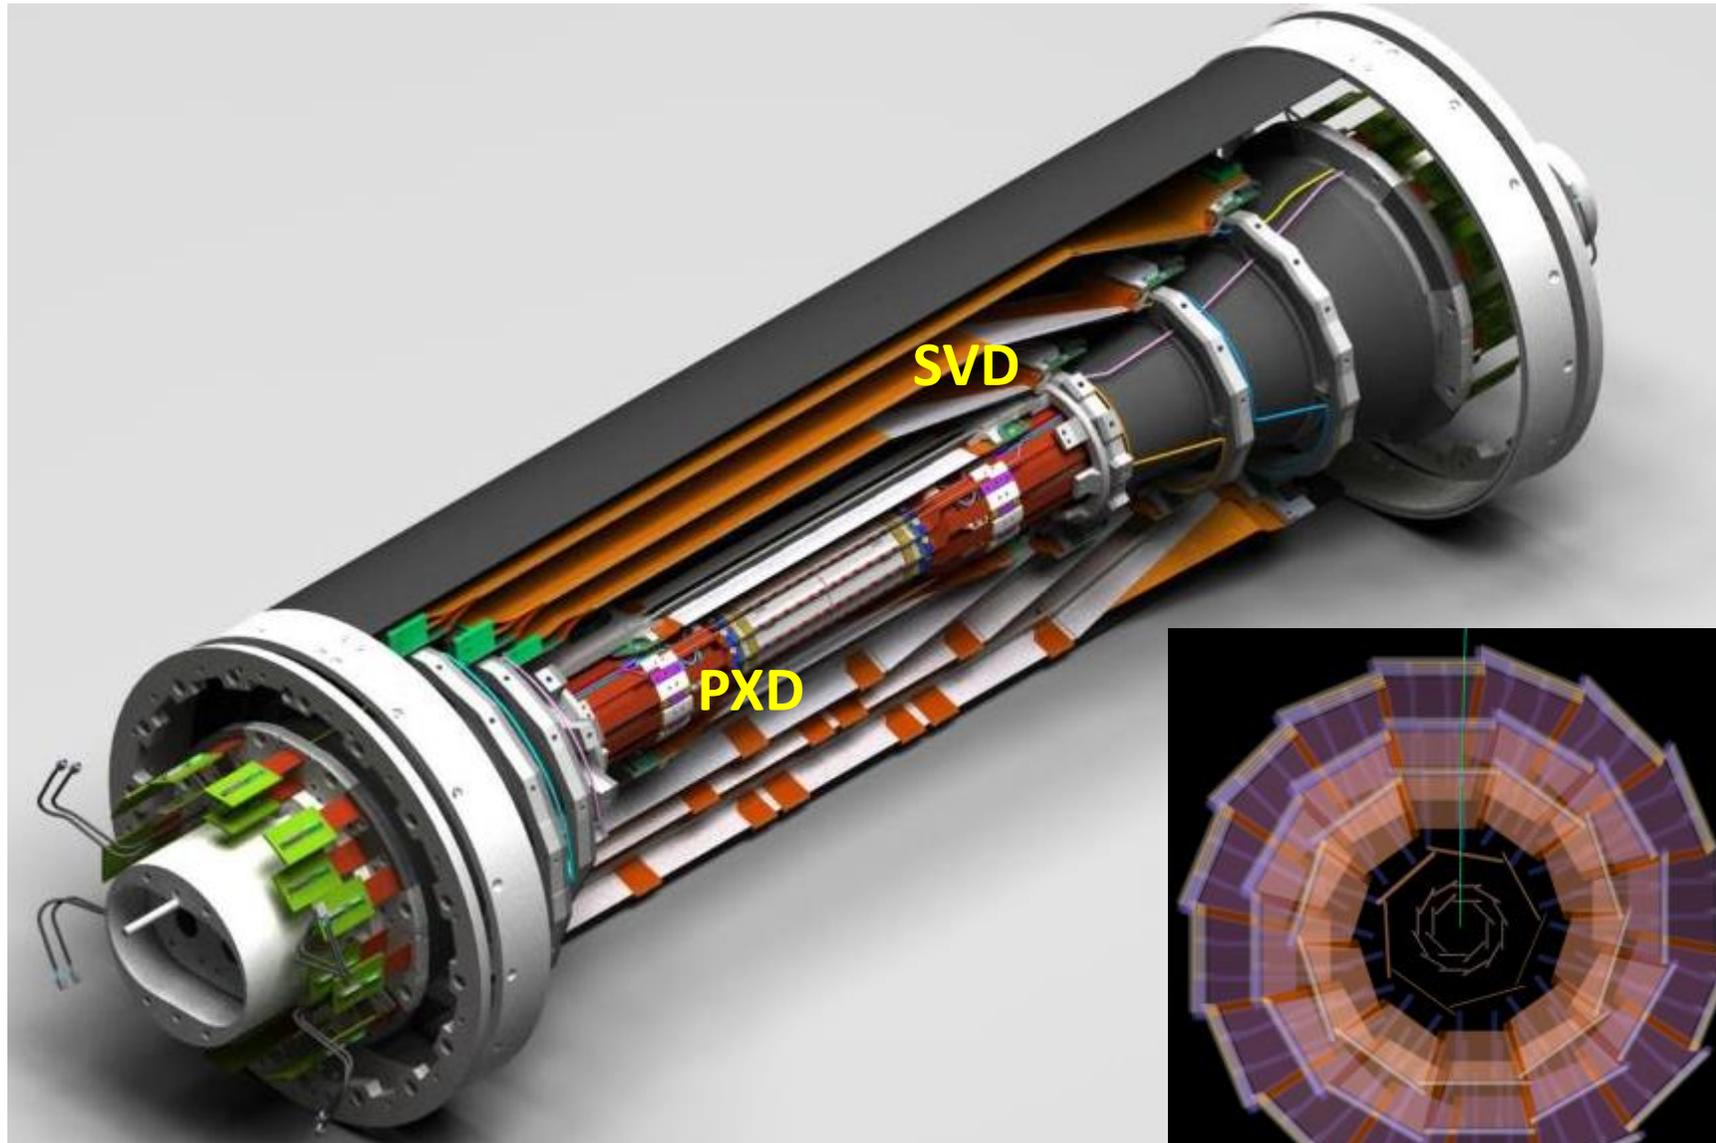

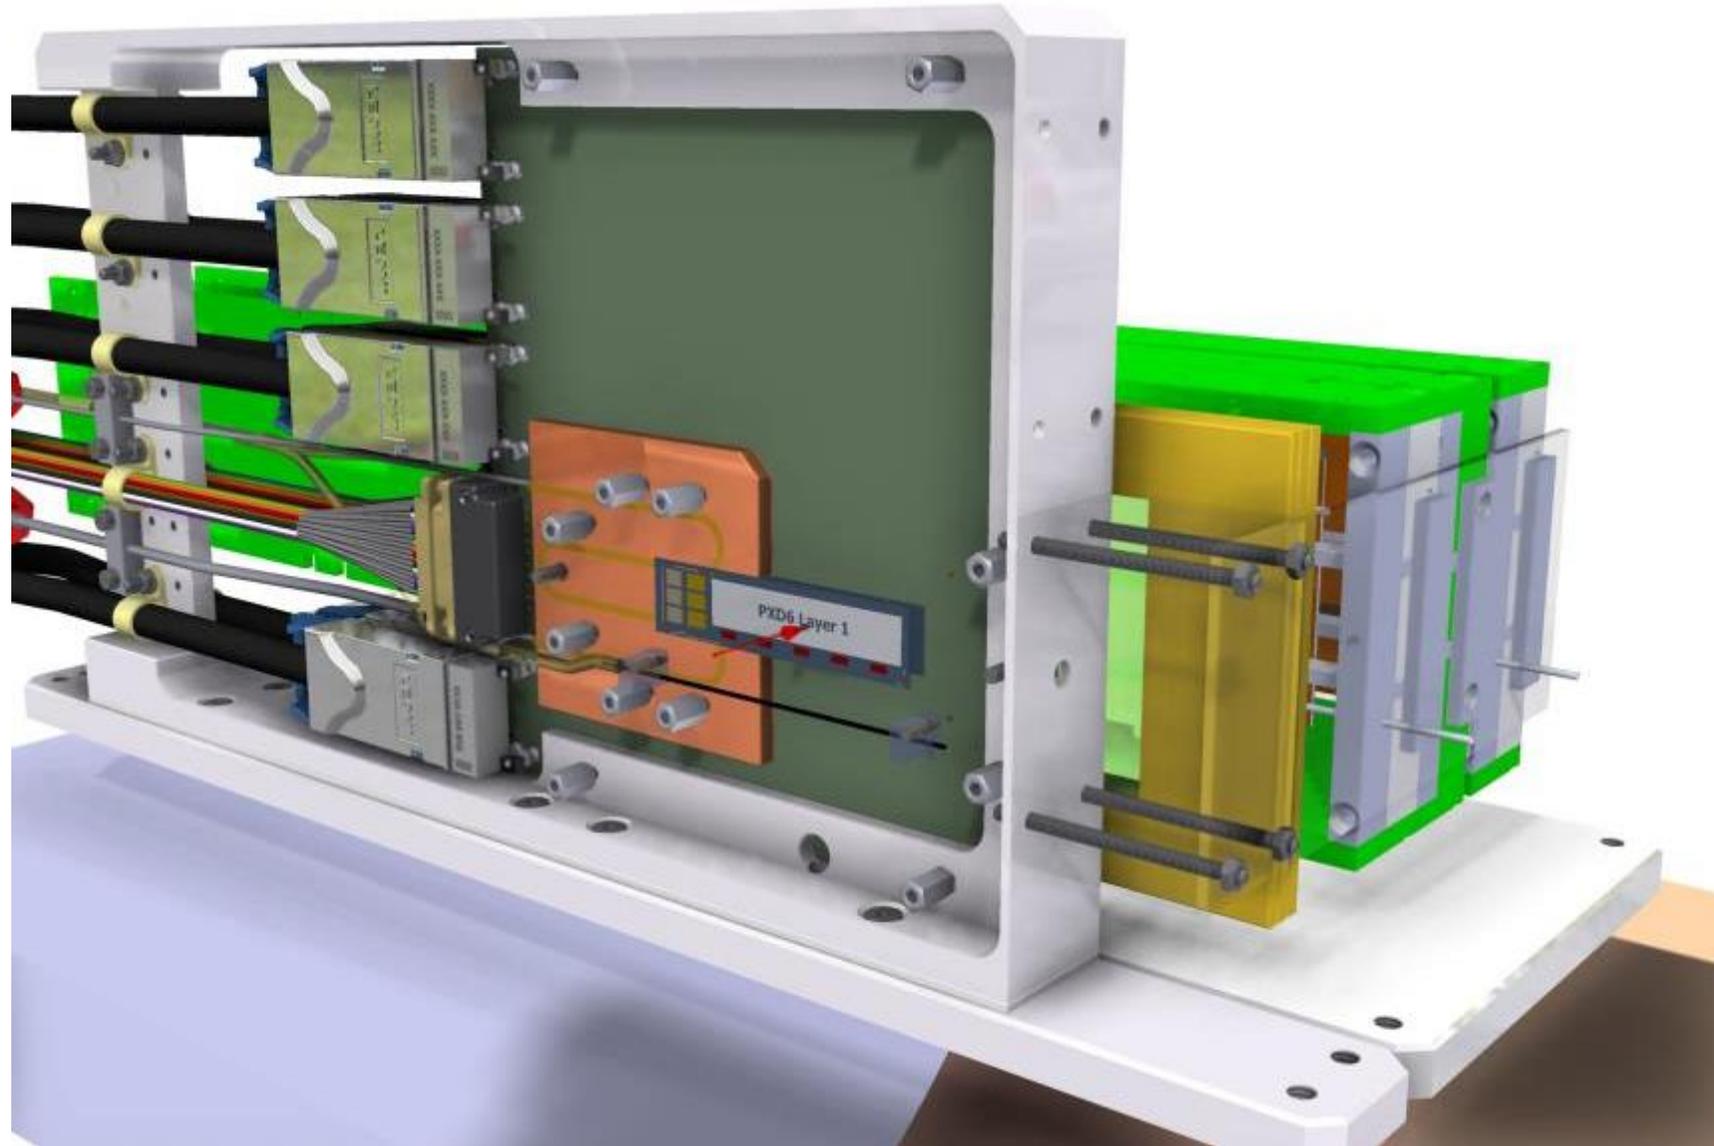

ILC Design

→ Extensively tested

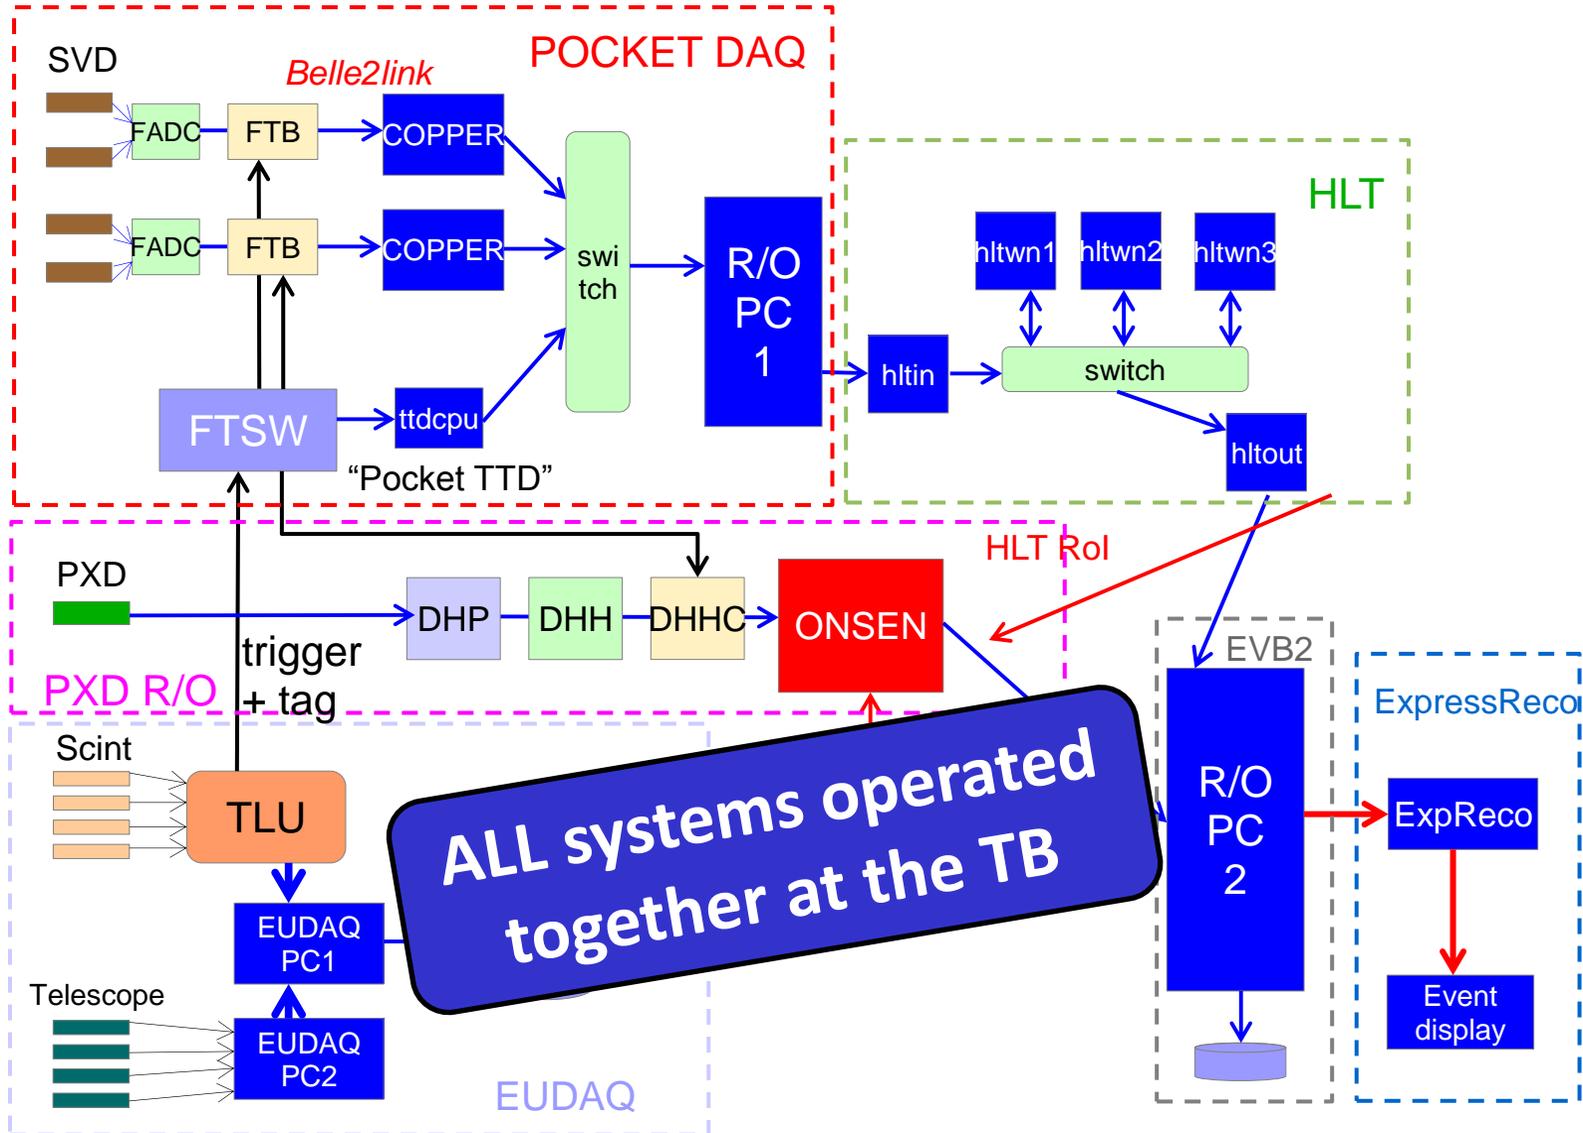

- PXD+SVD common test beam in January 2014
 - Small sector of the close to final prototype detectors and ASICs
PXD half ladder + 4 SVD single module layers
 - Readout using the complete DAQ chain
 - CO₂ cooling, slow control, environmental sensors
 - Alignment, tracking algorithms, ROI with B=1 Tesla
-
- **Goal: System integration test**

The Belle II Vertex Detector

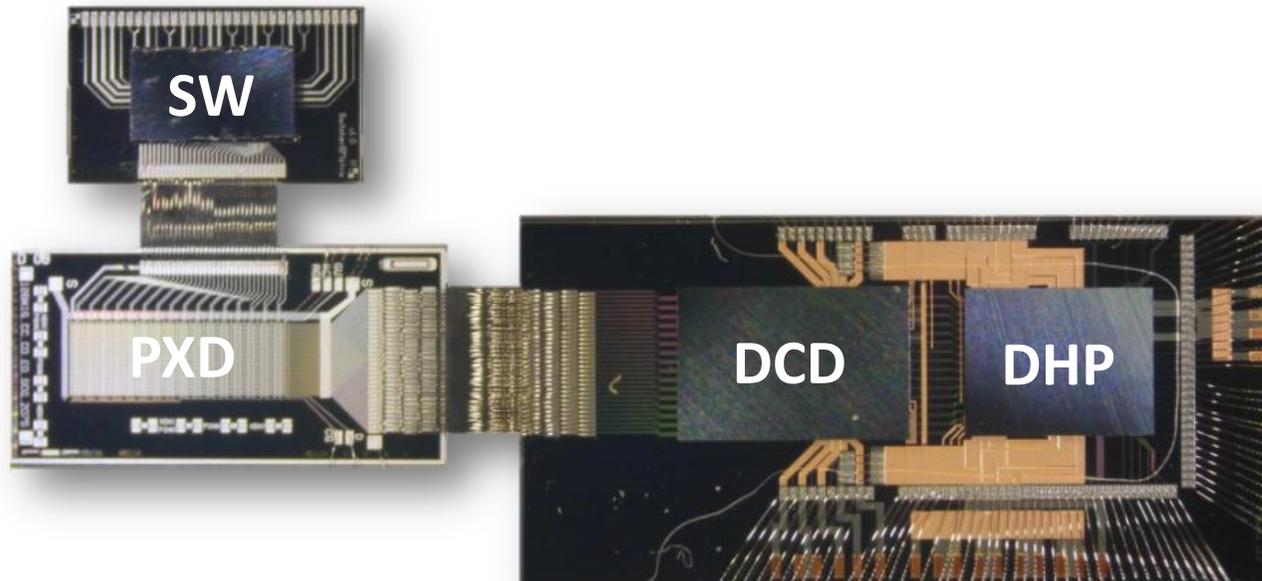

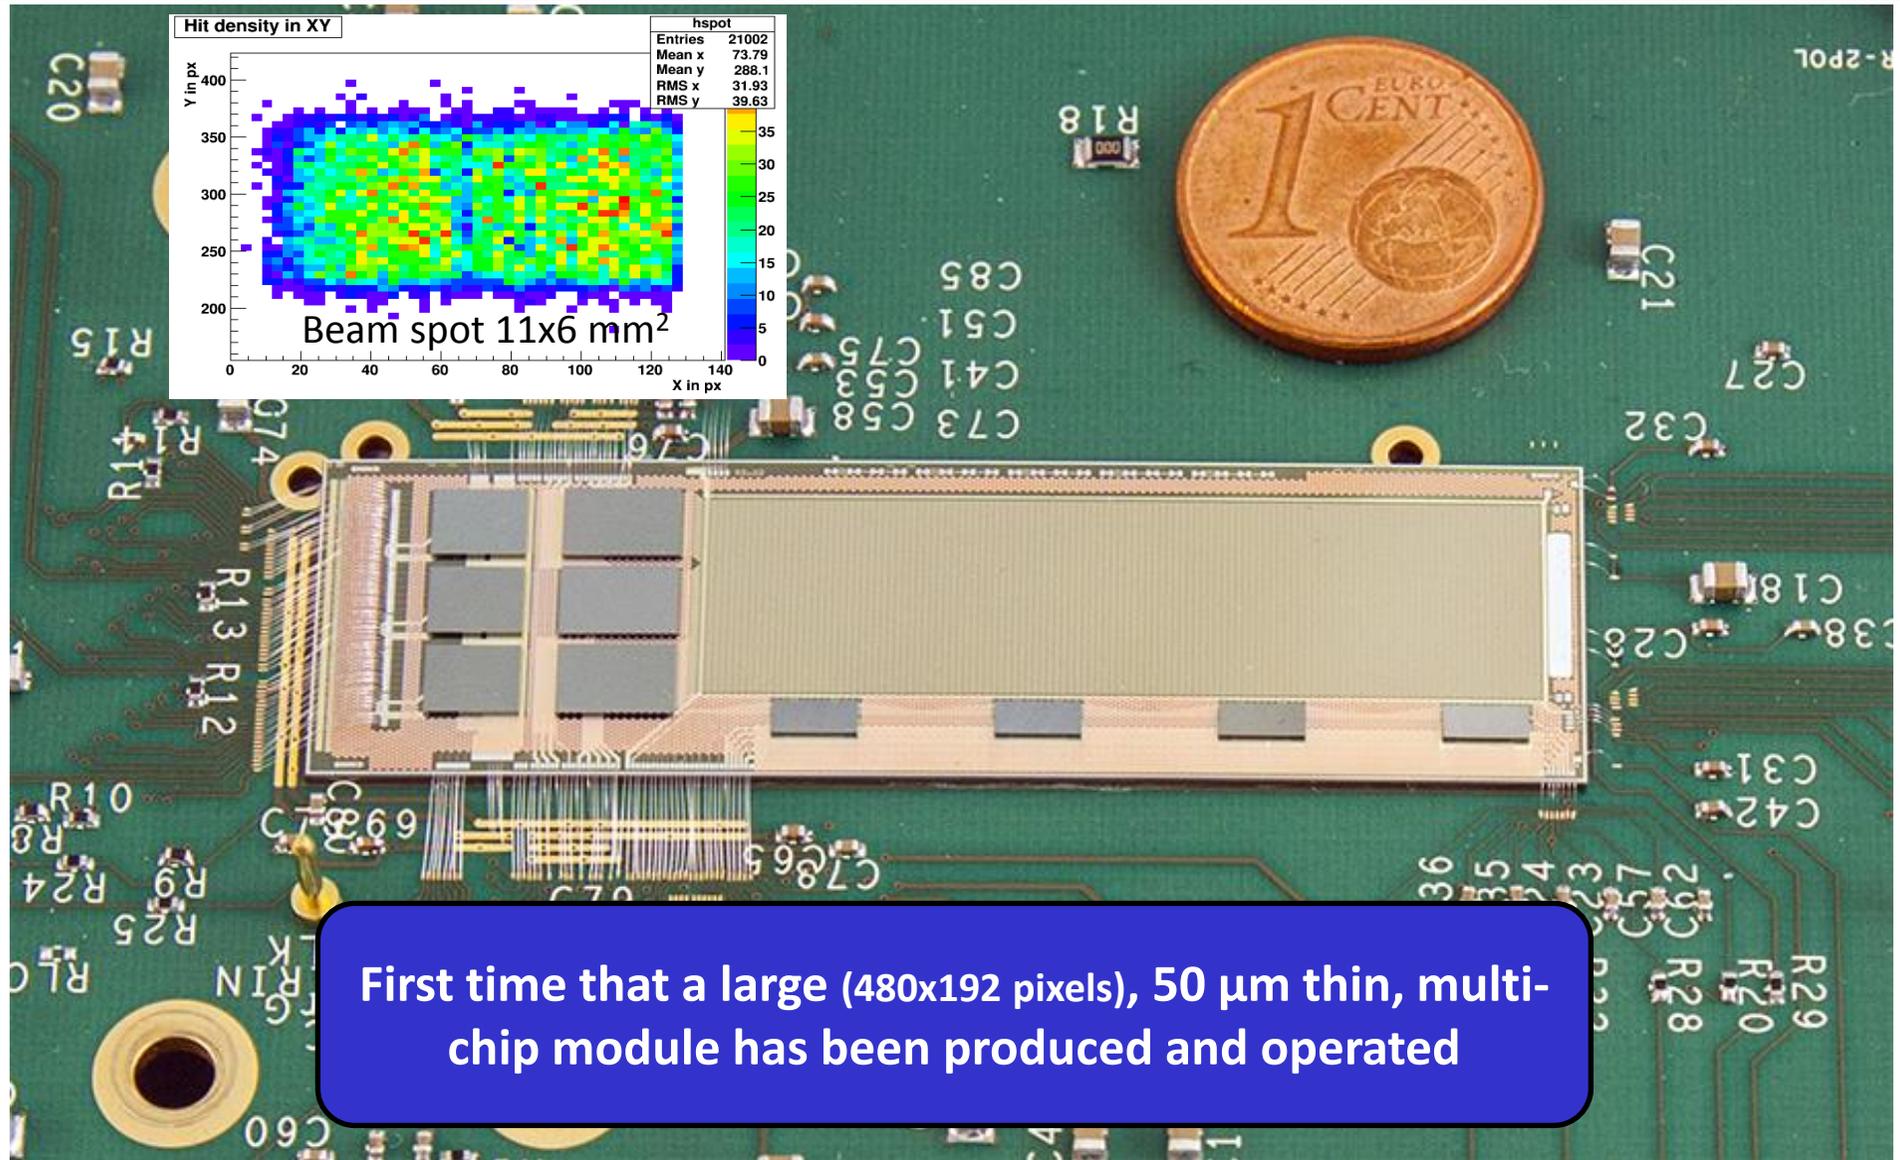

Test Beam DAQ Structure

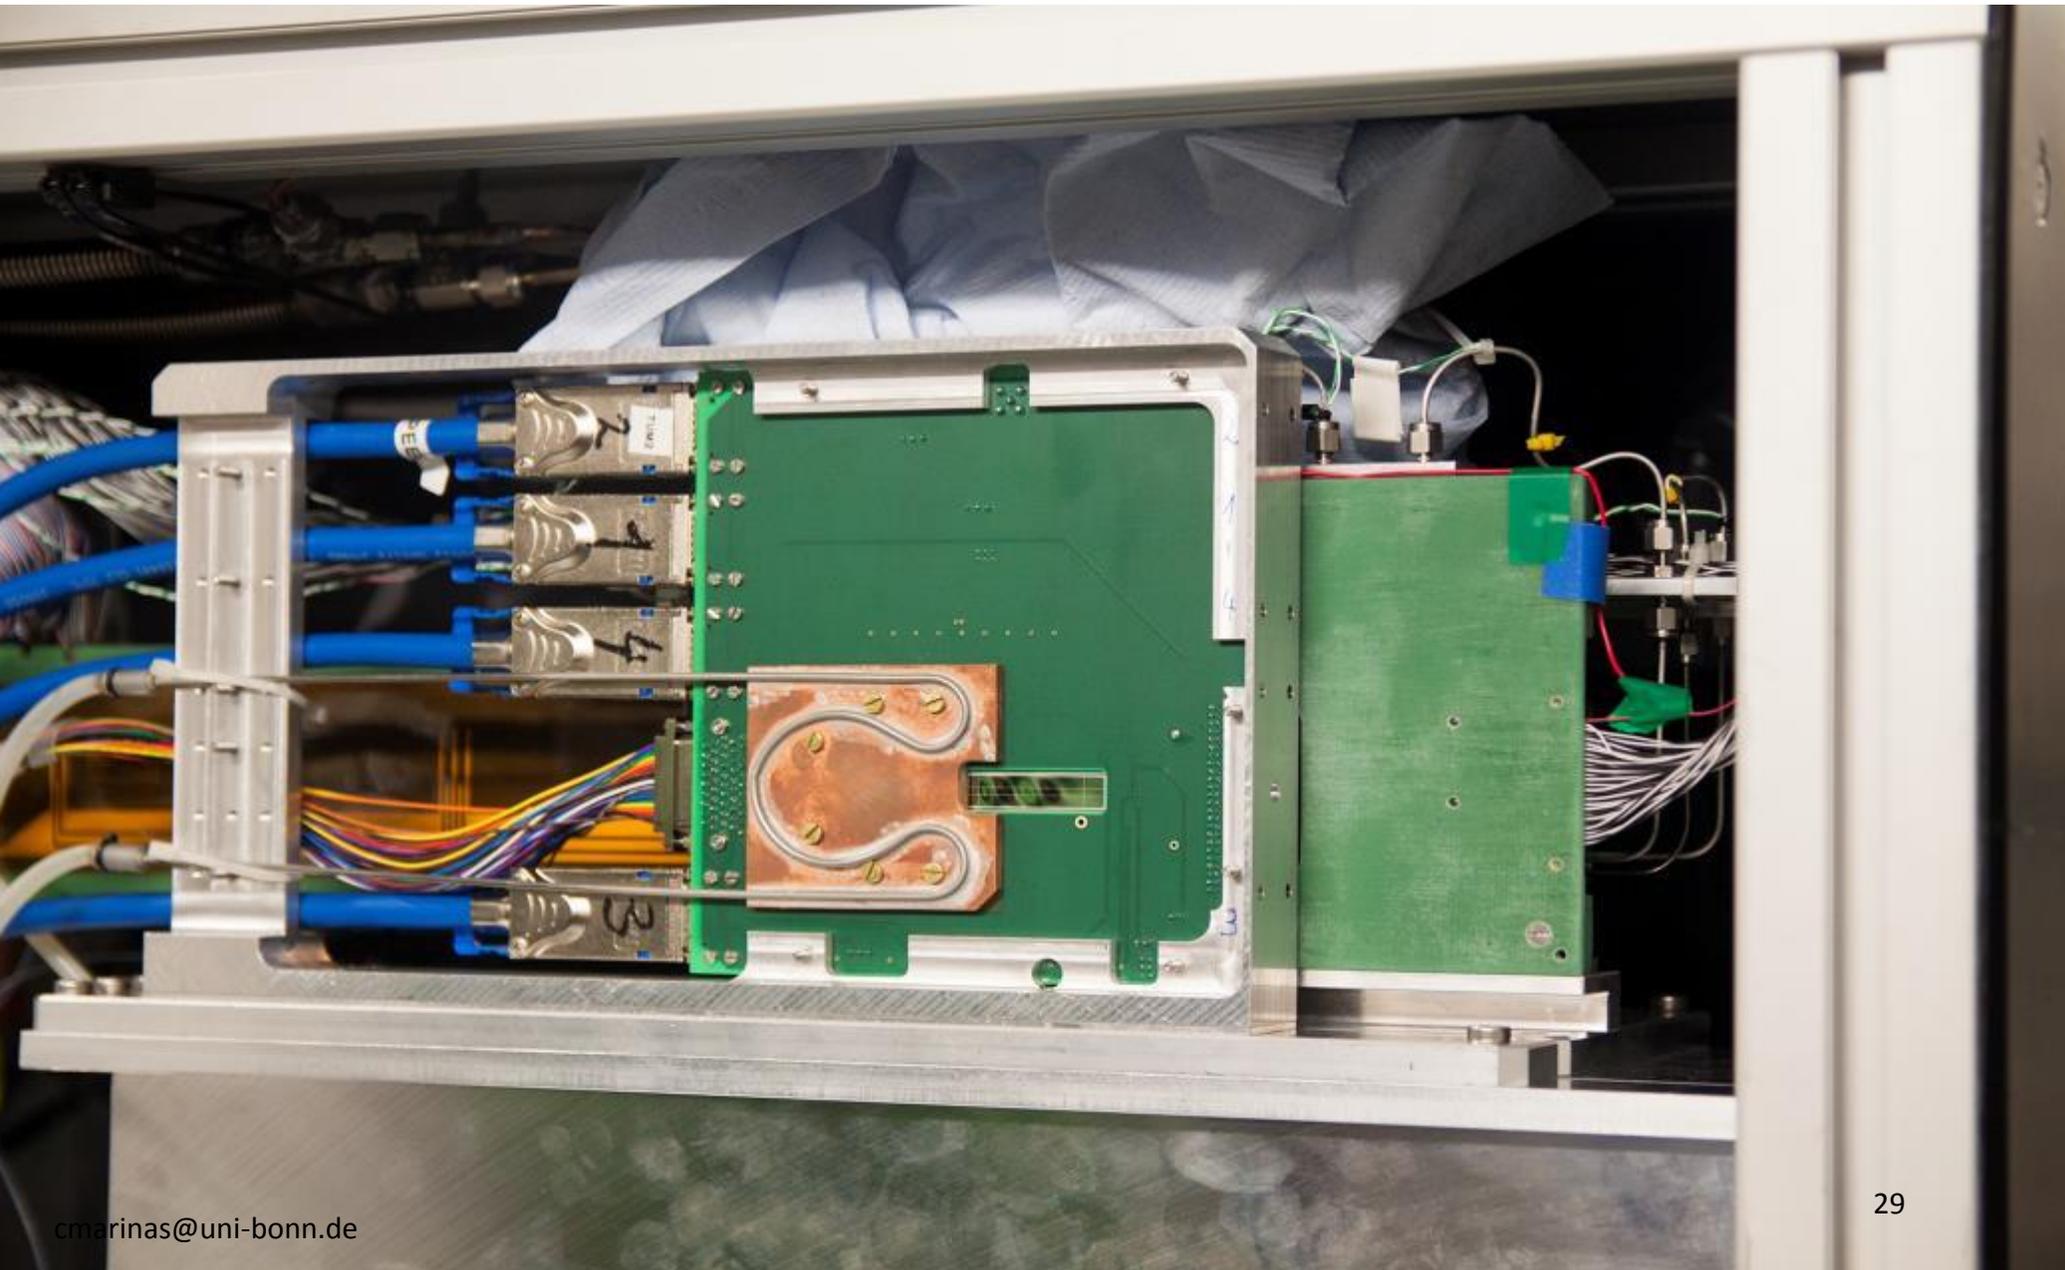

From this...

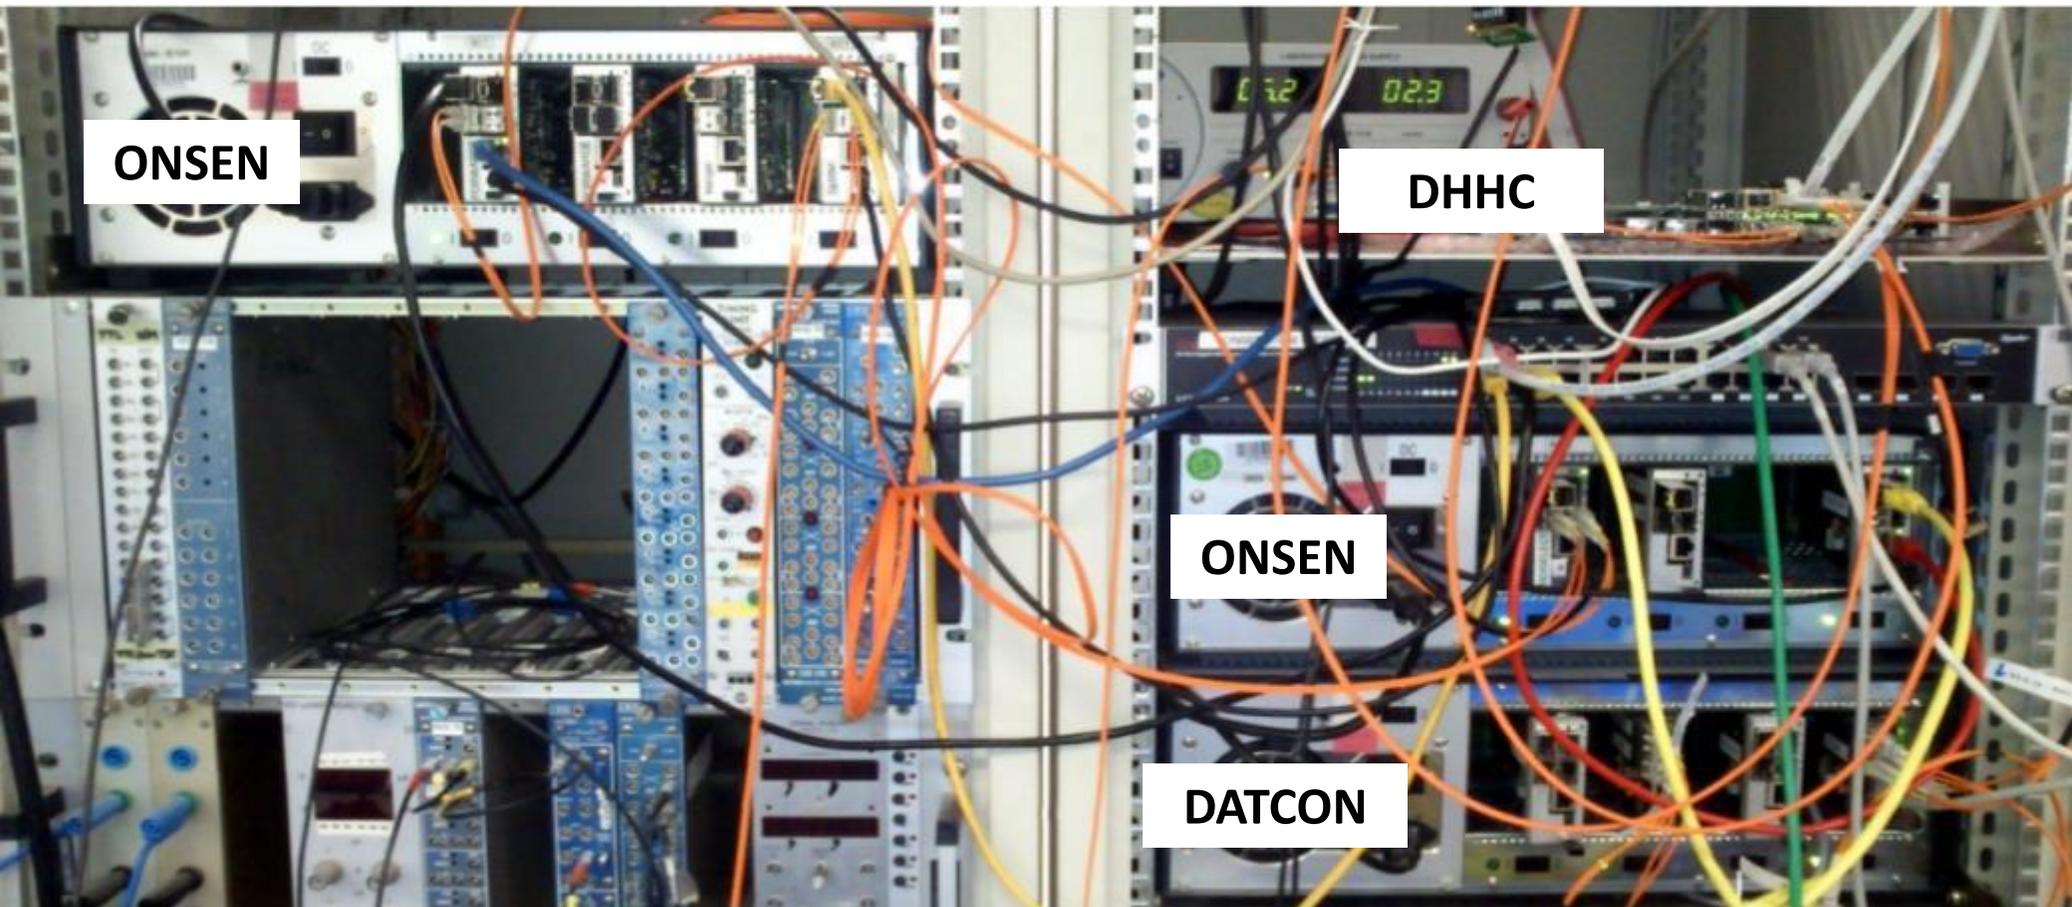

... to this

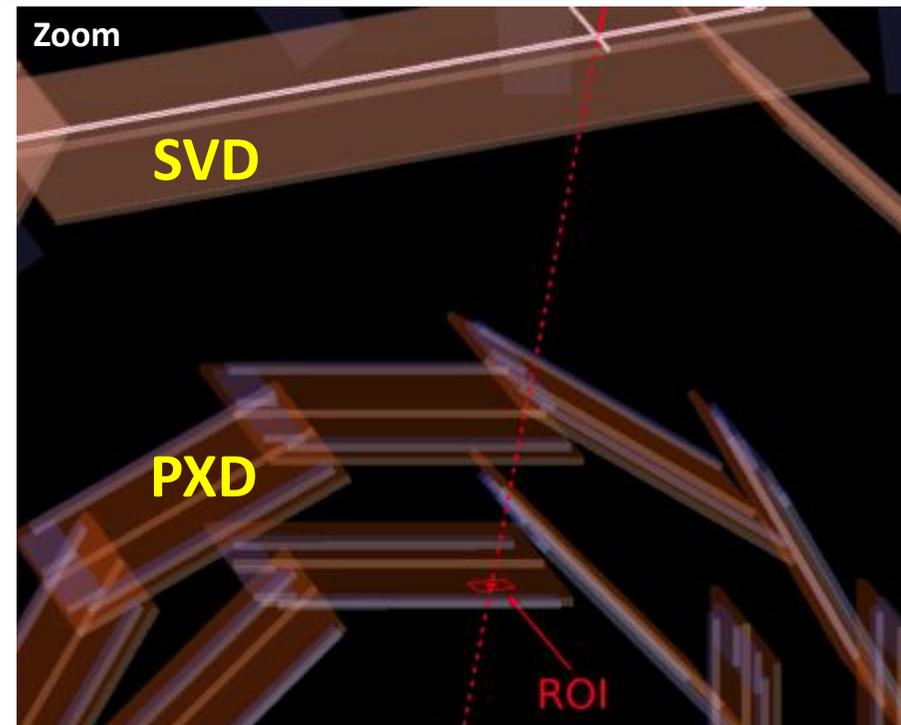

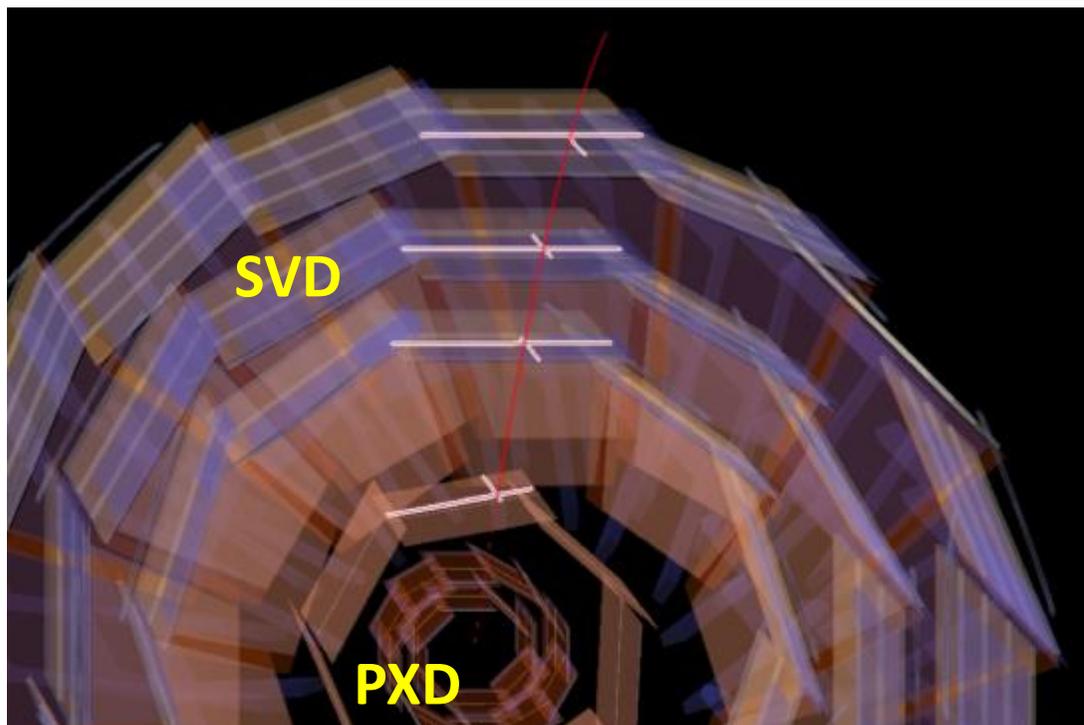

Test Beam Setup

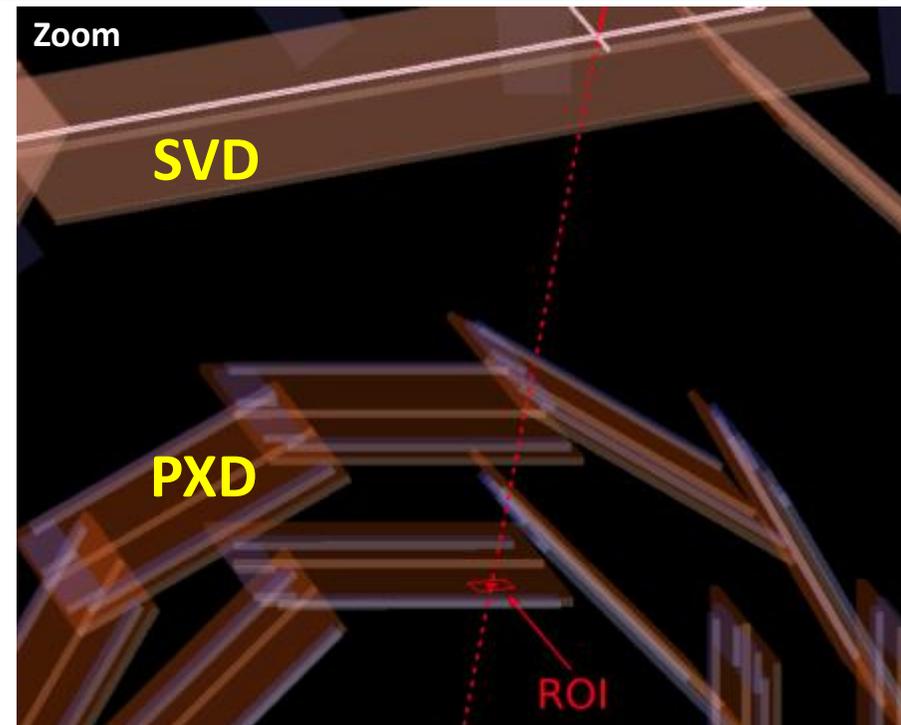

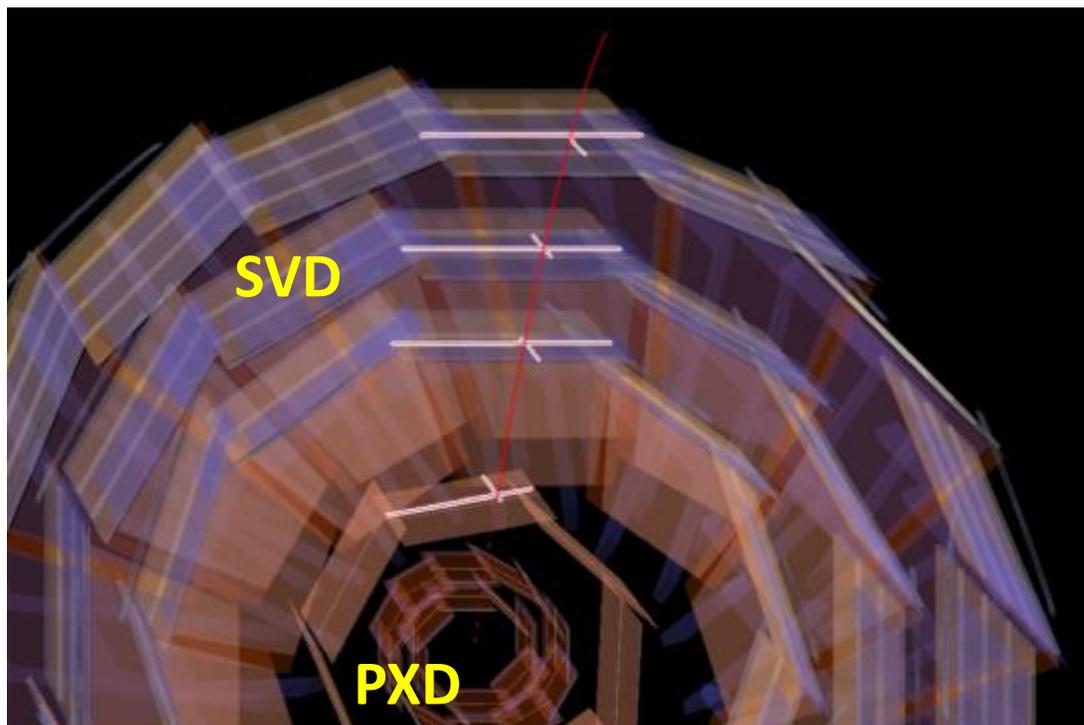

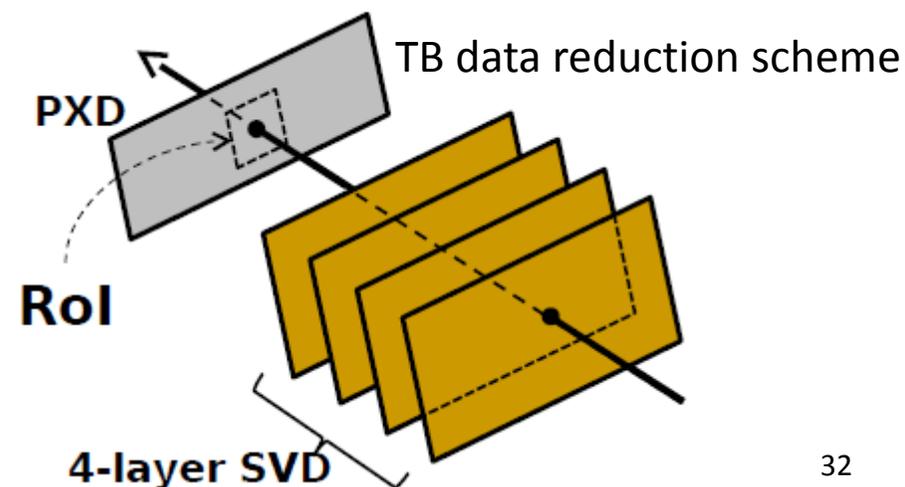

60 Million events recorded

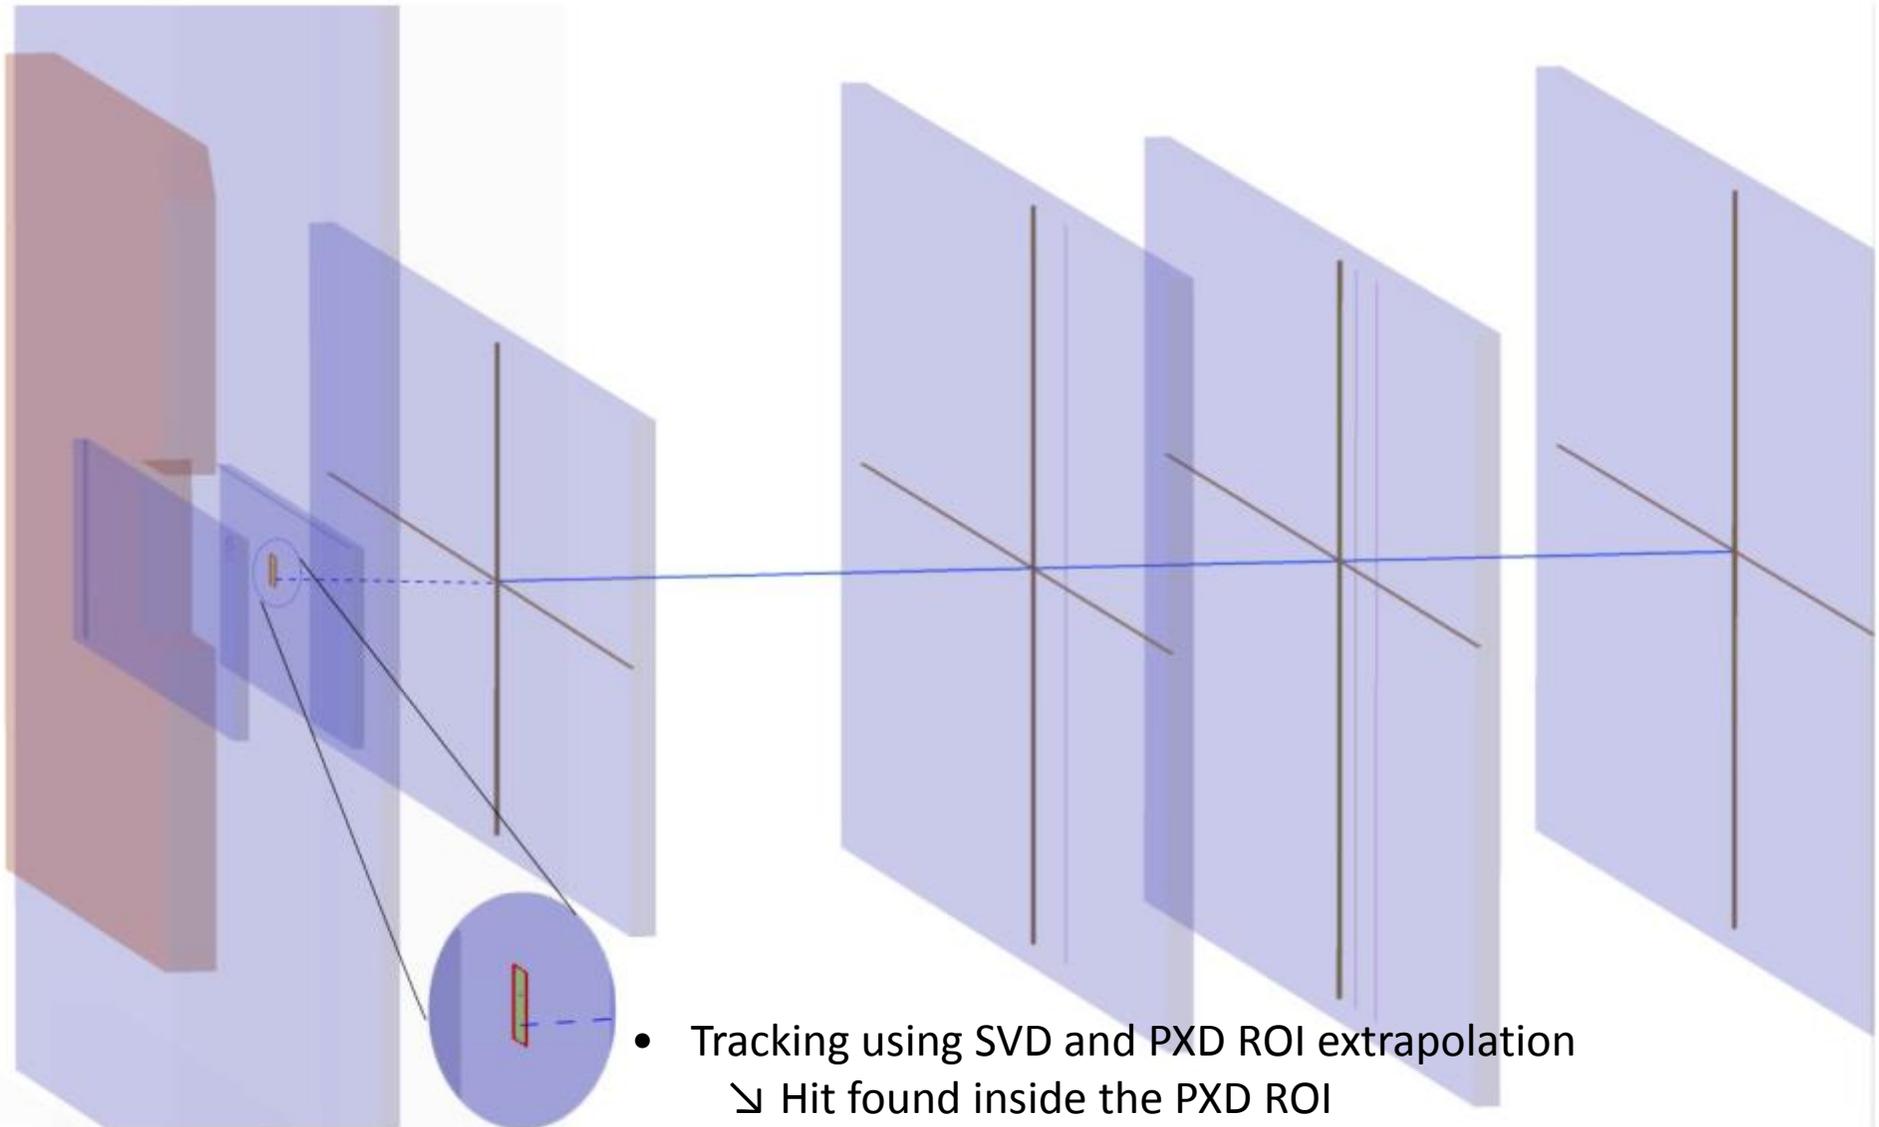

- Expected maximum occupancy 3%
- Total data rate >20 GB/s after zero suppression
- Data reduction (factor ≥ 10) needed for data storage
- Solution: region of interest (ROI) by track extrapolation from the outer detectors

- Expected maximum occupancy 3%
- Total data rate >20 GB/s after zero suppression
- Data reduction (factor ≥ 10) needed for data storage
- Solution: region of interest (ROI) by track extrapolation from the outer detectors

- Tracking using SVD and PXD ROI extrapolation
 ↳ Hit found inside the PXD ROI
- Factor 6 data reduction → Further investigations ongoing

Telescope

SVD

PXD

Telescope

Milestone for Belle II: Test beam measurements at the vertex detector successfully completed

Last Friday, a sophisticated test beam campaign has been completed at DESY, which provided important data for the operation of the vertex detector in the Belle II experiment. Over a period of four weeks, an international group of more than 30 scientists for the first time submitted prototypes of all components of the detector simultaneously to an integrated system test and checked the functions of the detector together with its entire intricate infrastructure. "The result is more than encouraging," said DESY project leader Carsten Niebuhr. "We were able to thoroughly test all aspects, including cooling with carbon dioxide, complex data taking and even the alignment of the detector layers – all this in a strong magnetic field, just as it will later take place in the real experiment." As the test is extremely important for the Belle II Collaboration, spokesman Tom Browder (University of Hawaii) came to Europe to observe the experiments first-hand. He too was very pleased with the result: "This 'mother of all beam tests' was really a big success. The conditions, support and infrastructure here at DESY perfectly matched our requirements for such a complex test."

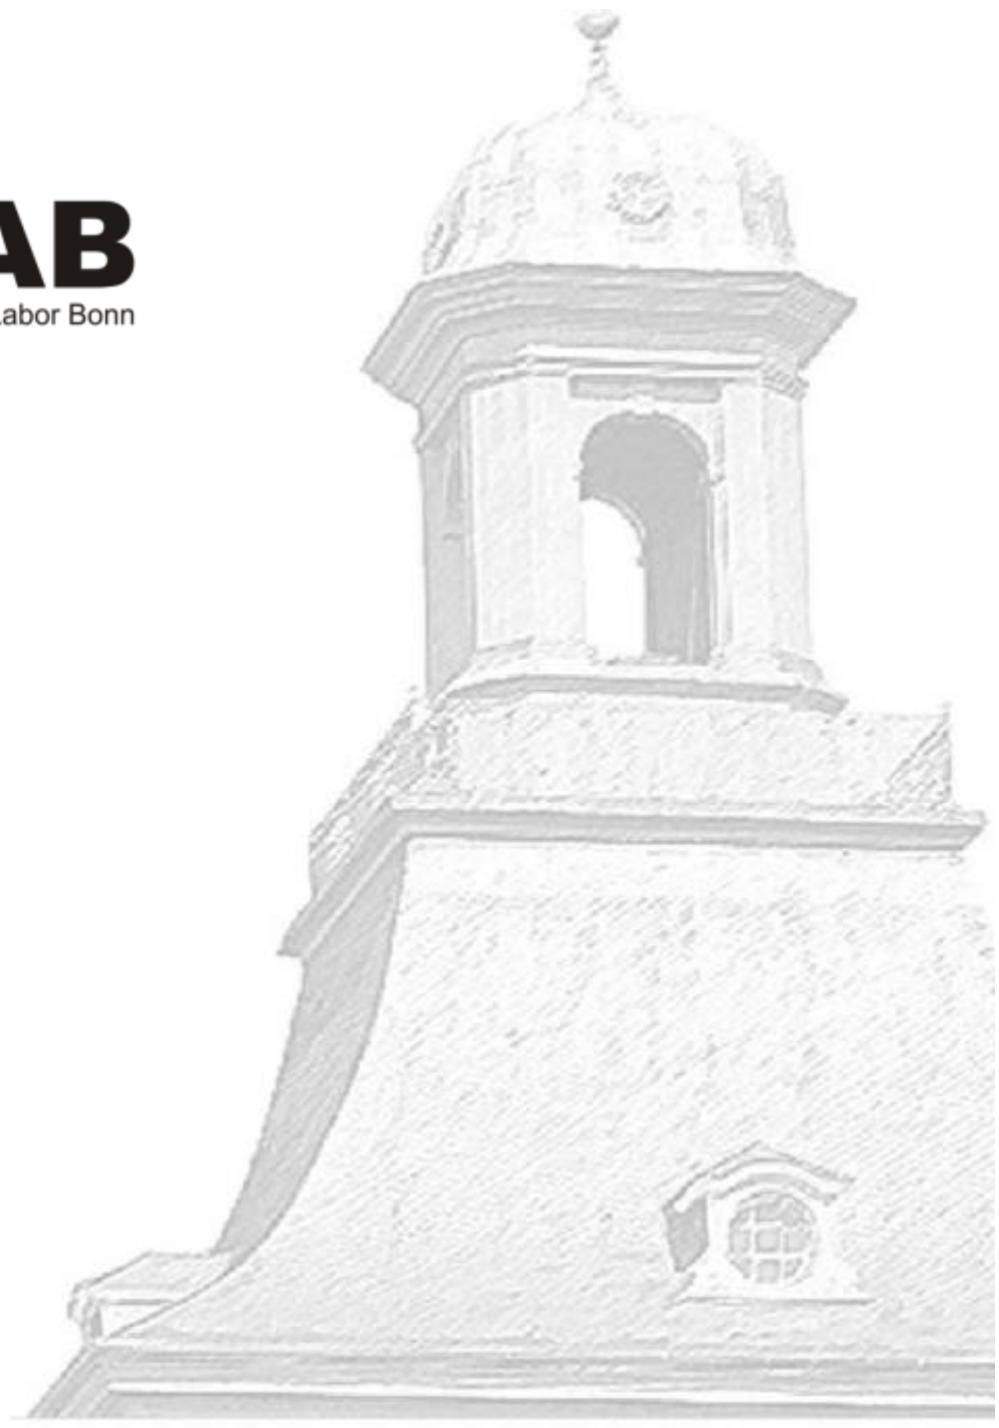

The Belle II experiment at the SuperKEKB accelerator in Japan, which will start operating in 2016, aims to solve one of the great mysteries of particle physics; that is, why the universe today is filled almost only with matter, although in the big bang, matter and antimatter should have been created in equal amounts.

- The DEPFET Collaboration is developing ultra-transparent pixel sensors with integrated amplification
- The good performance of the DEPFET detector system in terms of SNR, spatial resolution, readout speed is demonstrated
- The Belle II PXD boosted the development of DEPFET detectors
 - Direct benefit towards the ILC-VXD project (ILD-VXD layer concept '*engineered*')
- Building a real system: Every detail (although not covered here) is being considered
 - Cooling, mechanics, DAQ, ...

Thank you
