

Detector desing report

Team 2

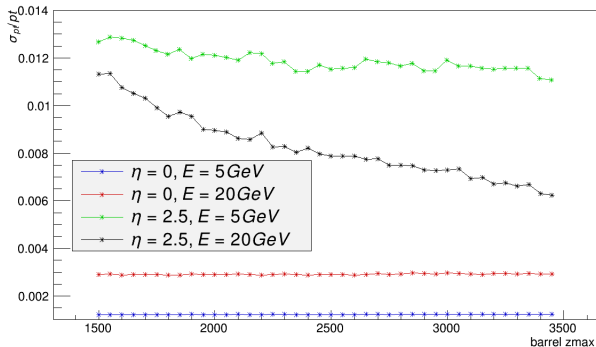

November 21, 2014

- Task was to design a detector for detecting low p_T muons
- $B_s \rightarrow \mu\mu$ and $B^0 \rightarrow \mu\mu$ decays were used as a benchmark channels
- The mass resolution of the B^0 and B_s mass peaks were required to be less than 60 MeV

- Magnetic field of 3.8 T was lowered to 3 T to enhance the rate of low- p_T muons in the muon chambers
- In order to improve p_T resolution for low- p_T muons, tracker was redesigned
- Other sub-detectors of CMS were not changed

Tracker optimisation

- Tracker p_T resolution as a function of z_{\max}

Tracker optimisation

- Tracker p_T resolution as a function of number of barrel layers for each module type

Tracker design

Mass plots

- The new tracker consisted of
 - 3 layers of pixel (PS) and strip (2S) modules in the barrel
 - 5 layers of disks in the endcaps
 - length along the beam axis was extended to 1.8 m
- The p_T resolution of tracker was improved, at $\eta = 2.5$ and $p_T = 5\text{GeV}$, from 1.64% to 1.21%
 - 30.2% increase in resolution !
