EM Calorimeters

Results within the SFB project B1

- Top-quark physics
 - ✓ Threshold expansions of hadronic cross sections
 - ✓ Results based on soft-gluon resummation at NNLL
 - ✓ Two-loop virtual corrections
 - ✓ Exact results for total cross sections at NNLO
 - ✓ Public software Top++
 - ✓ Complete off-shell effects in hadronic production with NLO accuracy
 - ✓ Production in association with two jets with NLO accuracy
 - ✓ Applications to PDF studies
 - ✓ Applications to BSM studies
- Subtraction scheme at NNLO
 - ✓ Development of STRIPPER (sector-improved residue subtraction)
 - ✓ Formulation in 't Hooft-Veltman regularization
- General interest
 - ✓ Soft-currents at one-loop with massive partons
 - ✓ Soft function for color octet production at threshold to NNLO

- PhD Students within the SFB
 1. Peter Bärnreuther
 2. Paul Fiedler
 3. David Heymes
- Postdocs within the SFB
 1. Giuseppe Bevilacqua
- Main external collaborators
 1. Alexander Mitov
 2. Costas Papadopoulos
 3. Malgorzata Worek

Status experiment

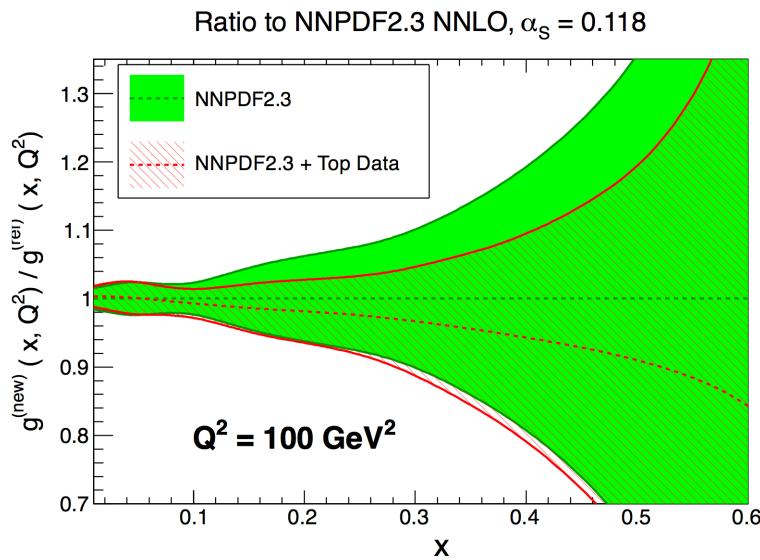

Summary of combinations of total cross section measurements

- Combining measurements from CDF and DØ gives a Tevatron cross section at 1.96 TeV c-o-m of $7.60 \pm 0.41(5.4\%) \text{ pb}$, to be compared with the theoretical calculation (NNLO+NNLL) $7.24^{+0.23}_{-0.27}(3.4\%) \text{ pb}$ (Czakon et. al.).
- Combining measurements from ATLAS and CMS gives a LHC cross section at 7 TeV c-o-m of $173 \pm 10(5.8\%) \text{ pb}$, to be compared to the theoretical calculation (NNLO+NNLL) of $172.0^{+6.4}_{-7.5}(4.1\%) \text{ pb}$.
- The most precise measurements at 8 TeV are from the ATLAS and CMS dilepton channel: $238 \pm 11(4.6\%) \text{ pb}$ and $227 \pm 15(6.6\%) \text{ pb}$.
The NNLO+NNLL SM prediction is $245.8^{+8.8}_{-10.6}(4.0\%) \text{ pb}$.

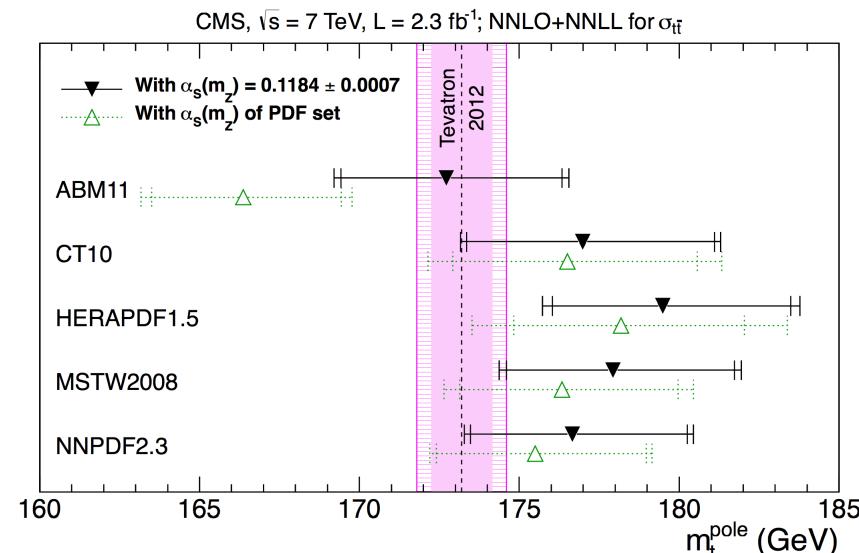

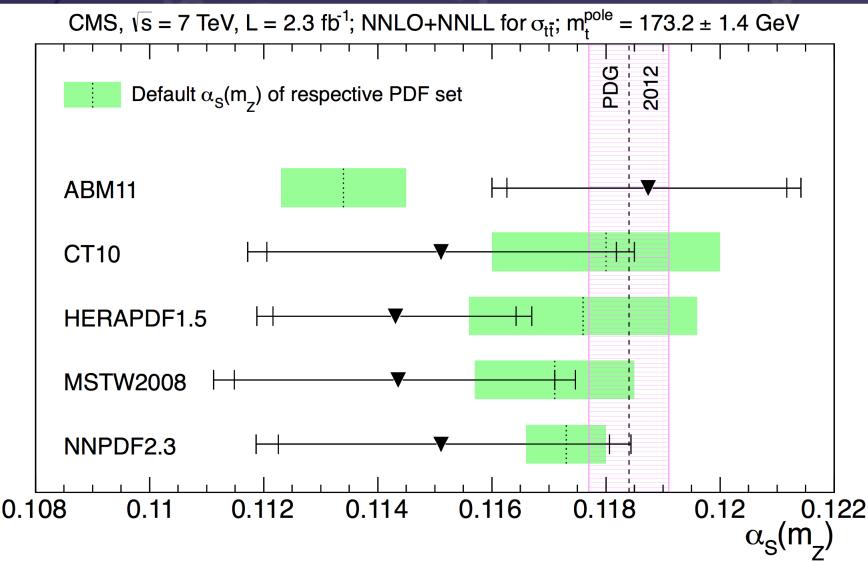

Applications

MC, Mitov, Papucci, Ruderman, Weiler, '14

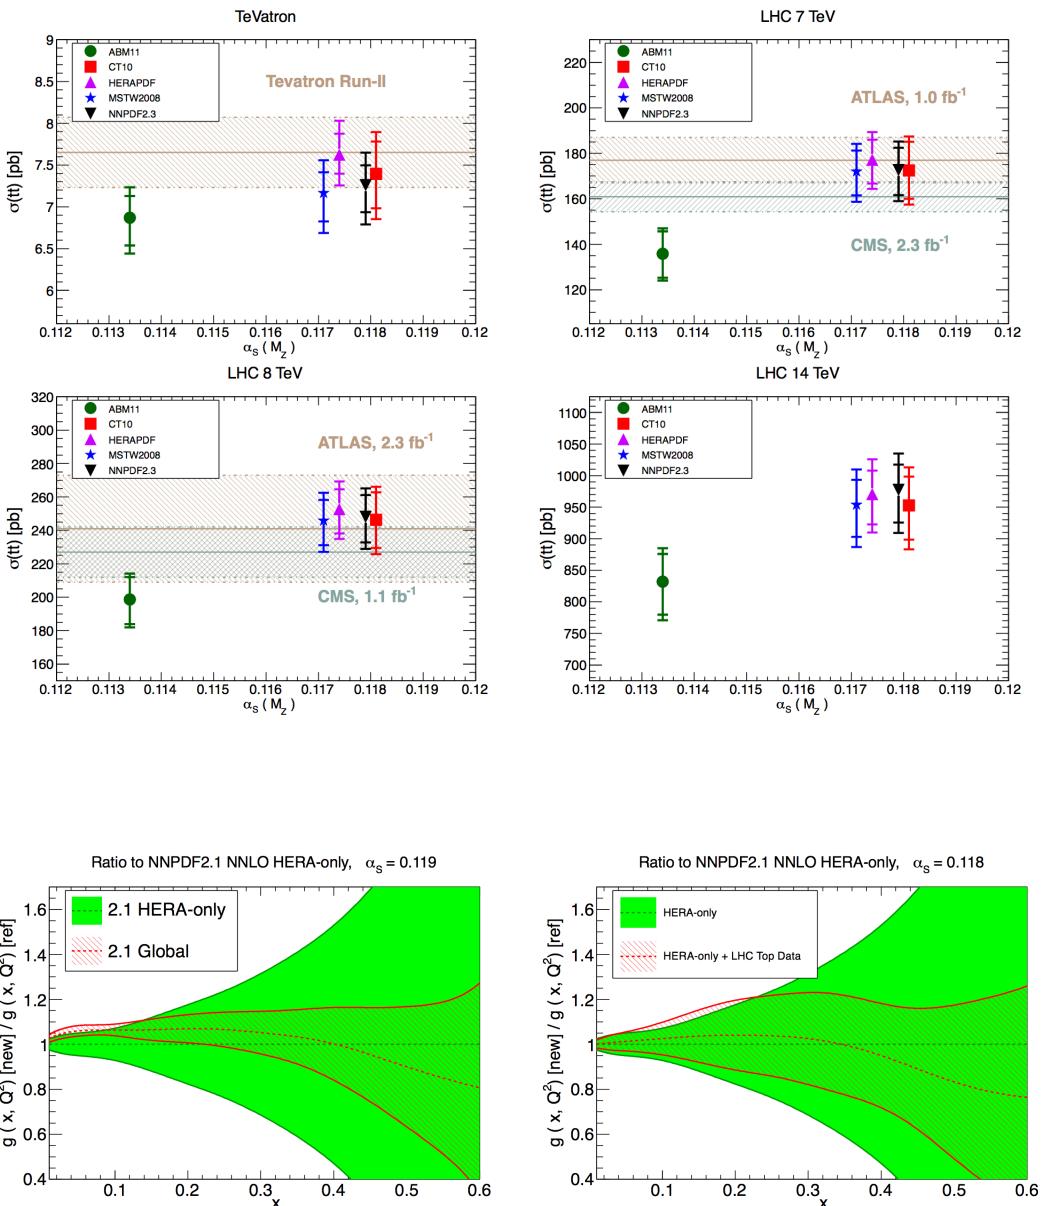

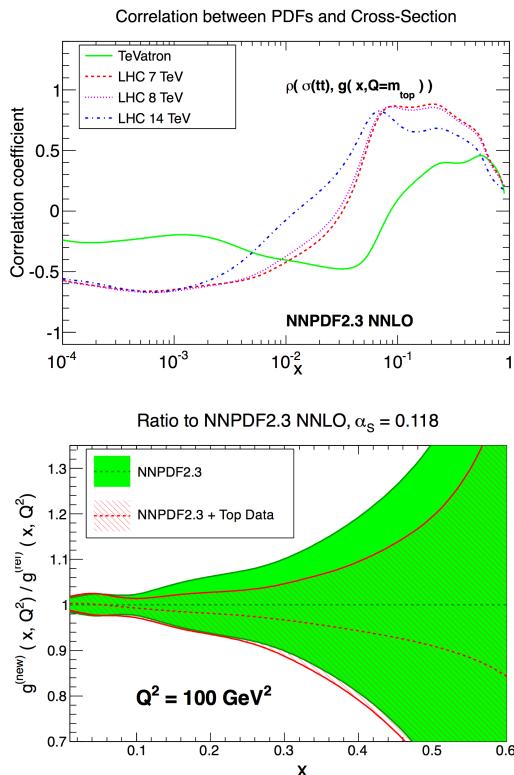

MC, Mangano, Mitov, Rojo '13

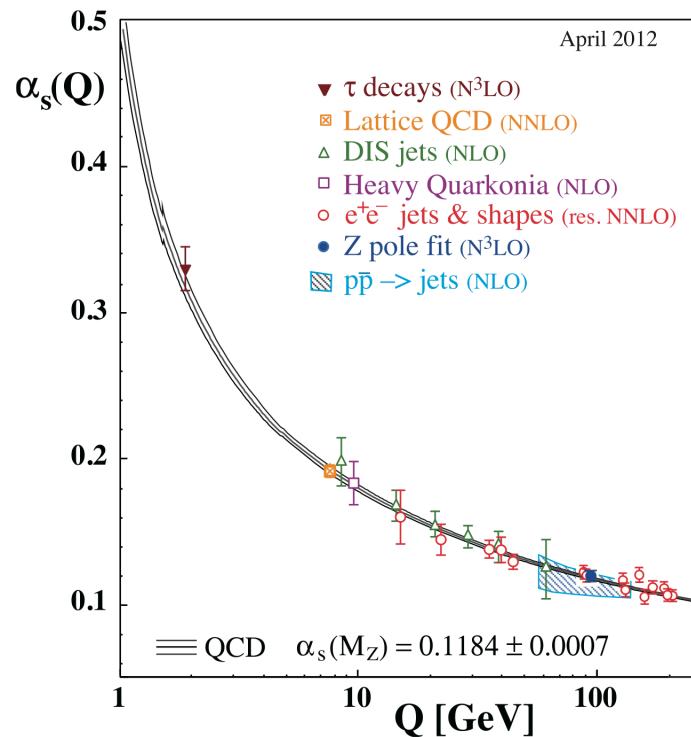

arXiv:1307.1907 (CMS-TOP-12-022)

Application to PDF determination

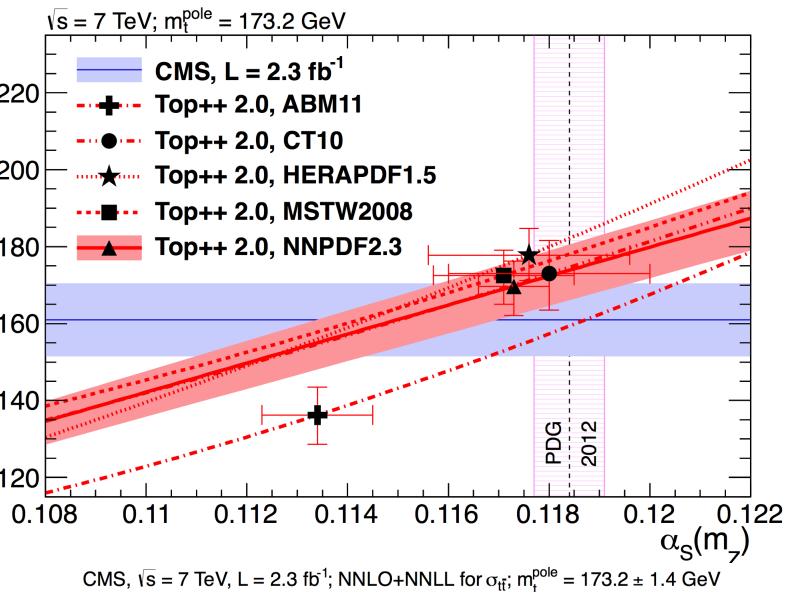

MC, Mangano, Mitov, Rojo '13

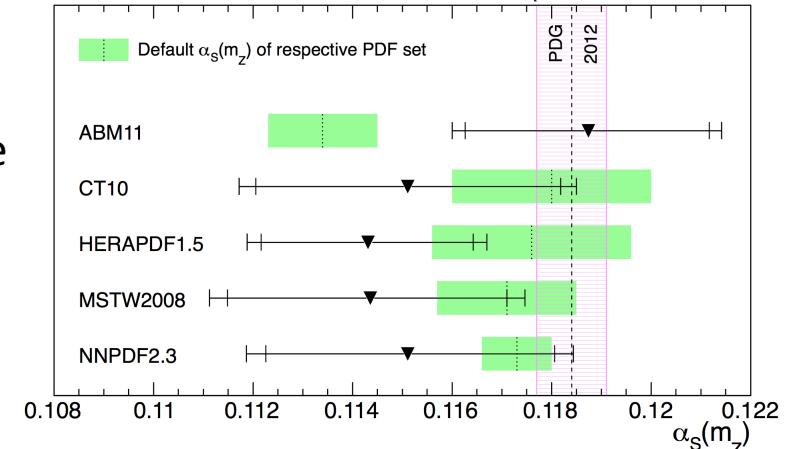

Application to α_s determination

arXiv:1307.1907 (CMS-TOP-12-022)

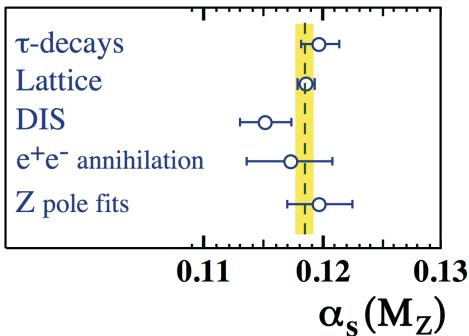

CMS, $\sqrt{s} = 7$ TeV, $L = 2.3 \text{ fb}^{-1}$; NNLO+NNLL for σ_{tt} ; $m_t^{\text{pole}} = 173.2 \pm 1.4$ GeV

First determination of the strong coupling at NNLO from a hadron collider

Competitive to other collider determinations

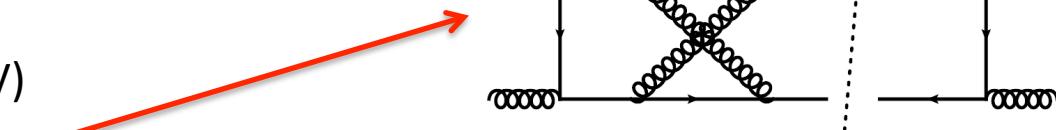

With NNPDF: $\alpha_s(m_Z) = 0.1151^{+0.0033}_{-0.0032}$

There are 3 principal contributions:

- 2-loop virtual corrections (V-V)

MC '07 (quark annihilation)

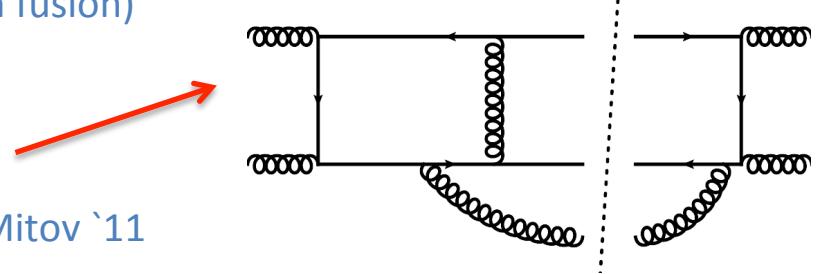

Bärnreuther, MC, Fiedler, in preparation (gluon fusion)

- 1-loop virtual with one extra parton (R-V)

code by Stefan Dittmaier

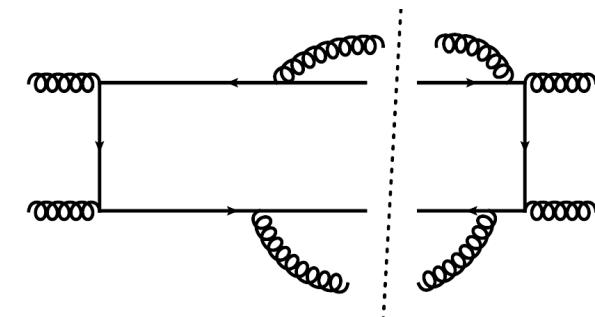

new subtraction terms: Bierenbaum, Czakon, Mitov '11

- 2 extra emitted partons at tree level (R-R)

MC '10 '11 invention of a new subtraction scheme

called STRIPPER

And 2 secondary contributions:

- Collinear subtraction for the initial state Known, in principle. Done numerically.
(the only non-differential contribution)

- One-loop squared amplitudes

Körner, Merebashvili, Rogal '07 (quark annihilation)
done from scratch for gluon fusion

Additionally: divergences of two-loop amplitudes in quark annihilation: Ferroglia, Neubert, Pecjak, Yang '09

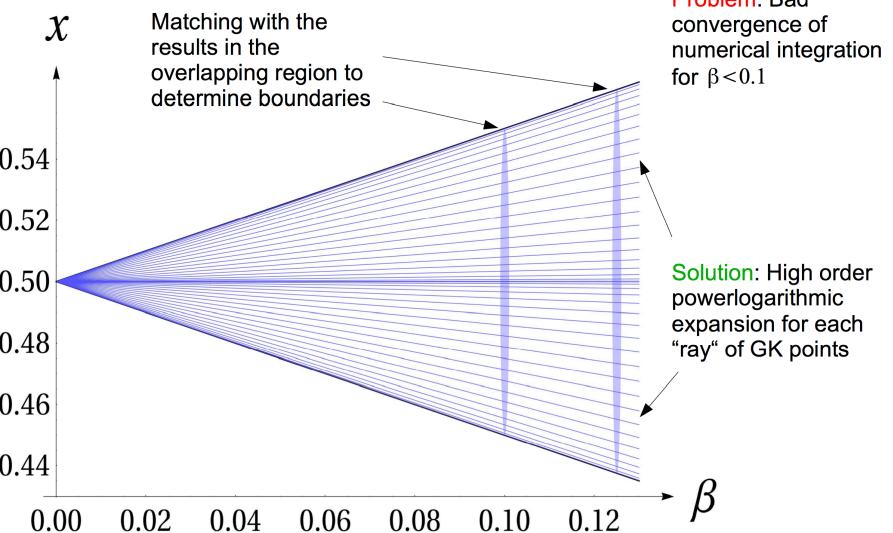

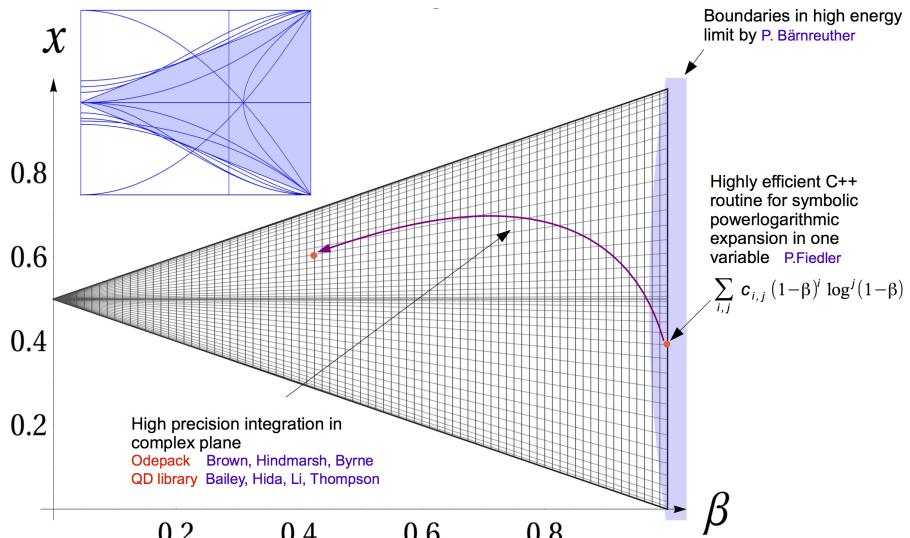

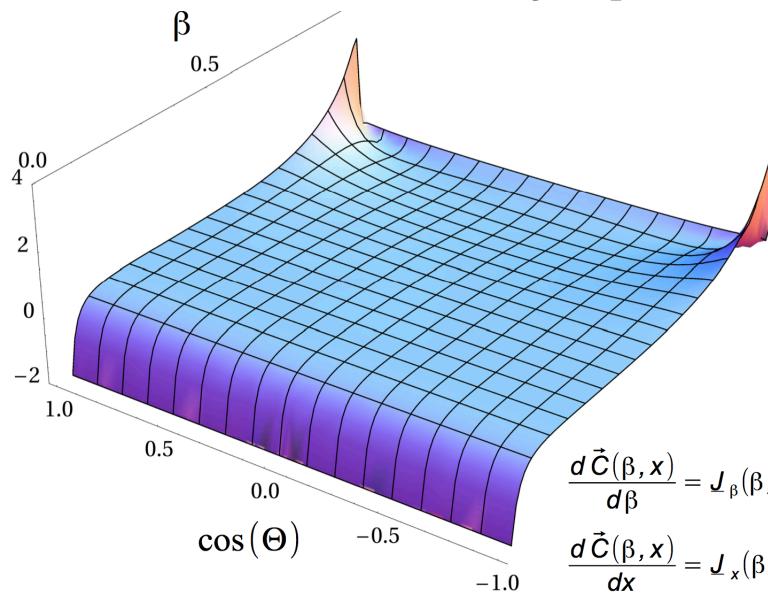

Two-loop amplitudes

Illustration: gluon fusion case

- 422 master integrals
- Solution by numerical differential equations & semi-analytic expansions
- Boundaries with Mellin-Barnes techniques
- About 1h per phase space point

$$M_i(\beta, x, \epsilon) = \sum_{k=\text{Min}}^{\text{Max}} C_{ik}(\beta, x) \epsilon^k$$

$M_i(\beta, x, \epsilon)$	Master integral
$C_{ik}(\beta, x)$	Coefficient of Laurent series
$x \equiv \frac{m^2 - \hat{t}}{\hat{s}} = \frac{1}{2}(1 - \beta \cos(\Theta))$	

ATLAS Matching coefficients @ NNLO

Beneke, MC, Falgari, Mitov, Schwinn '09

$$\sigma_{q\bar{q}}^{(2)} = \frac{3.60774}{\beta^2} + \frac{1}{\beta} \left(-140.368 \ln^2 \beta + 32.106 \ln \beta + 3.95105 \right)$$

$$+ 910.222 \ln^4 \beta - 1315.53 \ln^3 \beta + 592.292 \ln^2 \beta + 528.557 \ln \beta + C_{q\bar{q}}^{(2)}$$

$$\sigma_{gg}^{(2)} = \frac{68.5471}{\beta^2} + \frac{1}{\beta} \left(496.3 \ln^2 \beta + 321.137 \ln \beta - 8.62261 \right)$$

$$+ 4608 \ln^4 \beta - 1894.91 \ln^3 \beta - 912.349 \ln^2 \beta + 2456.74 \ln \beta + C_{gg}^{(2)}$$

- Matching coefficients can be obtained from factorization
MC, Fiedler '13

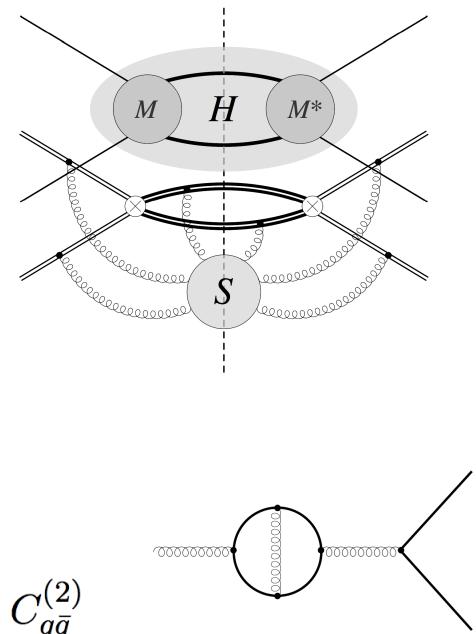

- Requires virtual corrections and soft function
Bärnreuther, MC, Fiedler '13

$$C_{gg}^{(2)} = 503.664 - 29.9249 n_l + 0.142857 n_l^2 = 357.611$$

$$C_{q\bar{q}}^{(2)} = 1104.08 - 42.9666 n_l - 4.28168 n_l^2 = 782.208$$

$$\sigma_{q\bar{q}}^{(2)} = \frac{3.60774}{\beta^2} + \frac{1}{\beta} \left(-140.368 \ln^2 \beta + 32.106 \ln \beta + 3.95105 \right)$$

$$+ 910.222 \ln^4 \beta - 1315.53 \ln^3 \beta + 592.292 \ln^2 \beta + 515.397 \ln \beta + C_{q\bar{q}}^{(2)}$$

General subtraction scheme invented as consequence of difficulties in treating double-real radiation for top quark pair production MC '10

Real radiation for tops in most channels calculated as first application in MC '11

Subsequently applied by others to several non-trivial problems:

- $Z \rightarrow e^+e^-$ (as a warmup) Boughezal, Melnikov, Petriello '11
- top quark decay Brucherseifer, Caola, Melnikov '13
- $b \rightarrow X_u e\nu$ Brucherseifer, Caola, Melnikov '13
- $H + \text{jet}$ Boughezal, Caola, Melnikov, Petriello, Schulze '13
- Muon decay spin asymmetry Caola, Czarnecki, Liang, Melnikov, Szafron '14
- Single top-quark production Brucherseifer, Caola, Melnikov '14

ATLAS

Conclusions and outlook

- Provided state of the art results for top-quark cross sections
- Developed a new subtraction scheme with non-trivial applications
- Differential description of top-pair production nearly finished
- Future work on
 1. Combined NNLO production and decay for top-pairs
 2. Publicly available implementation of STRIPPER
