

Tasks that could use manpower

Studies: What can we get out of our backend configuration? (discriminator/RHU path)

LUT

- Further studies on useful algorithms? (so far studies revealed nothing new) Not necessarily in terms of linear luminosity algorithms, but anything else...?

MGD

- Which gates are best to pick out lumi? (and avoid albedo)
- Which gates are best to pick out background? (and avoid albedo)

RHU bins

- Which bins give us best lumi/background values?

Compare MGD gating with RHU-bins-only
