Who are you?
Which version?
What can you do?
What are you doing?
What functions can you perform?

A standard Hardware API architecture for use in xTCA Community

- structural and methodological approach to device access;
- promote interoperability between hardware and software developed in different institutions;

Device

Module #1

Module #2

Module #3

- Standard set of registers that will
 - Identify the Hardware, Version and Vendor
 - Status and control of capabilities
 - Identify and control of device Interrupts
 - Addresses of all modules implemented
 - Identify the Module, Version and Vendor
 - Status and control of capabilities of module
 - Interrupts it can generate

Addressable I/O space through which various devices functions may be managed

- The fundamental data access element is a *register*
- *Registers* are 32 bit wide

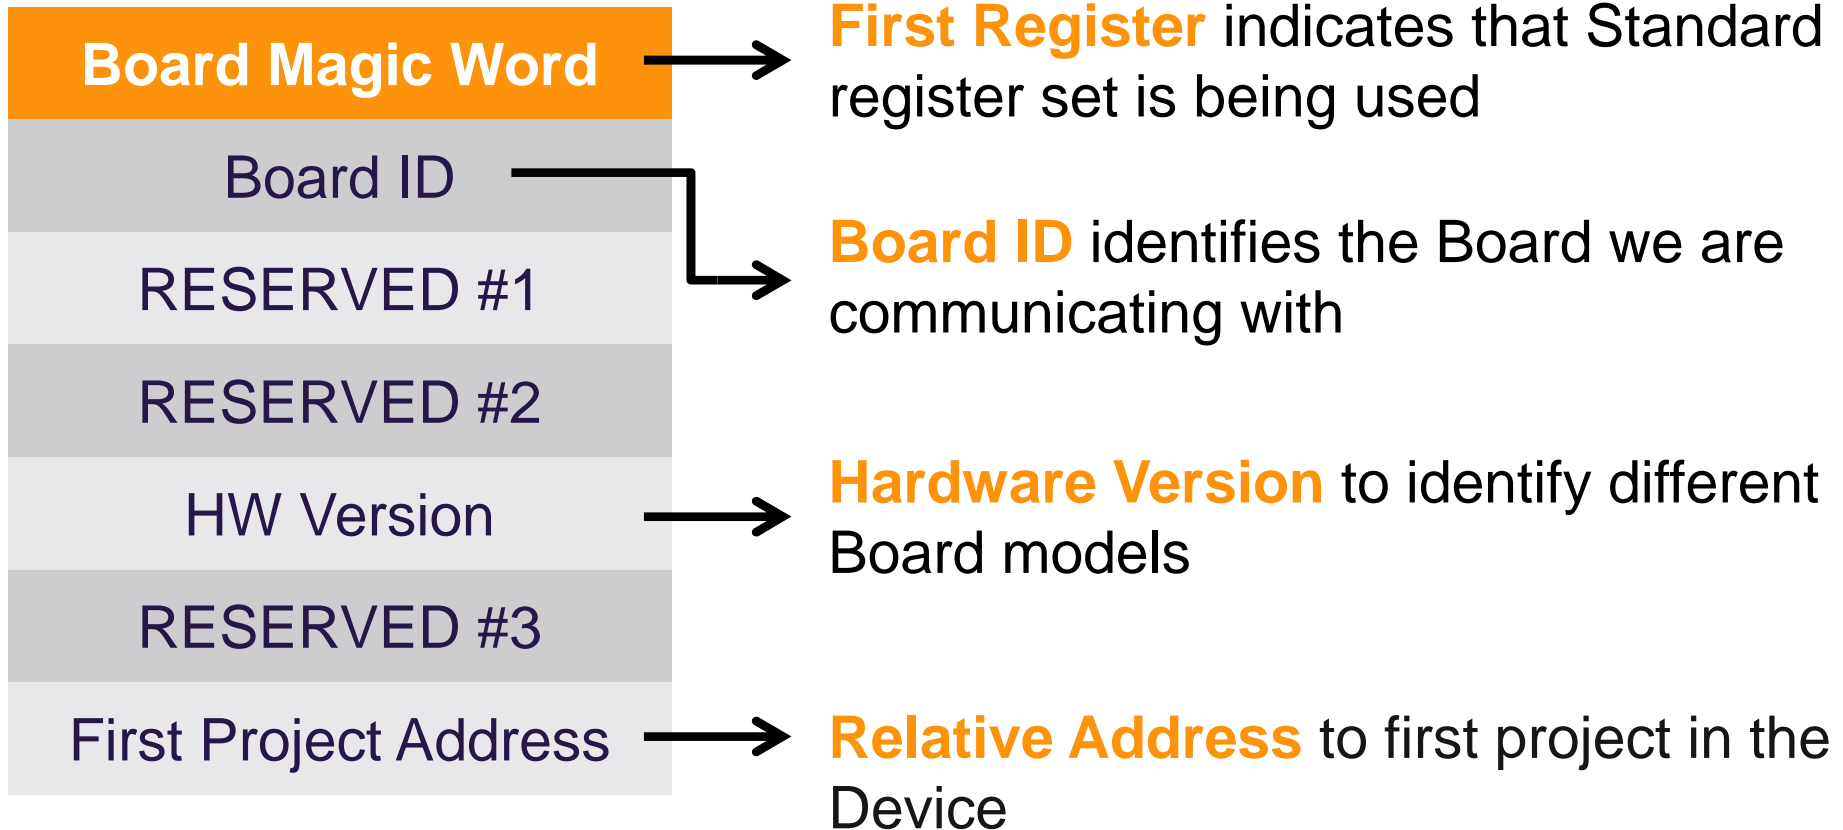

Standard registers
that identify **Device**

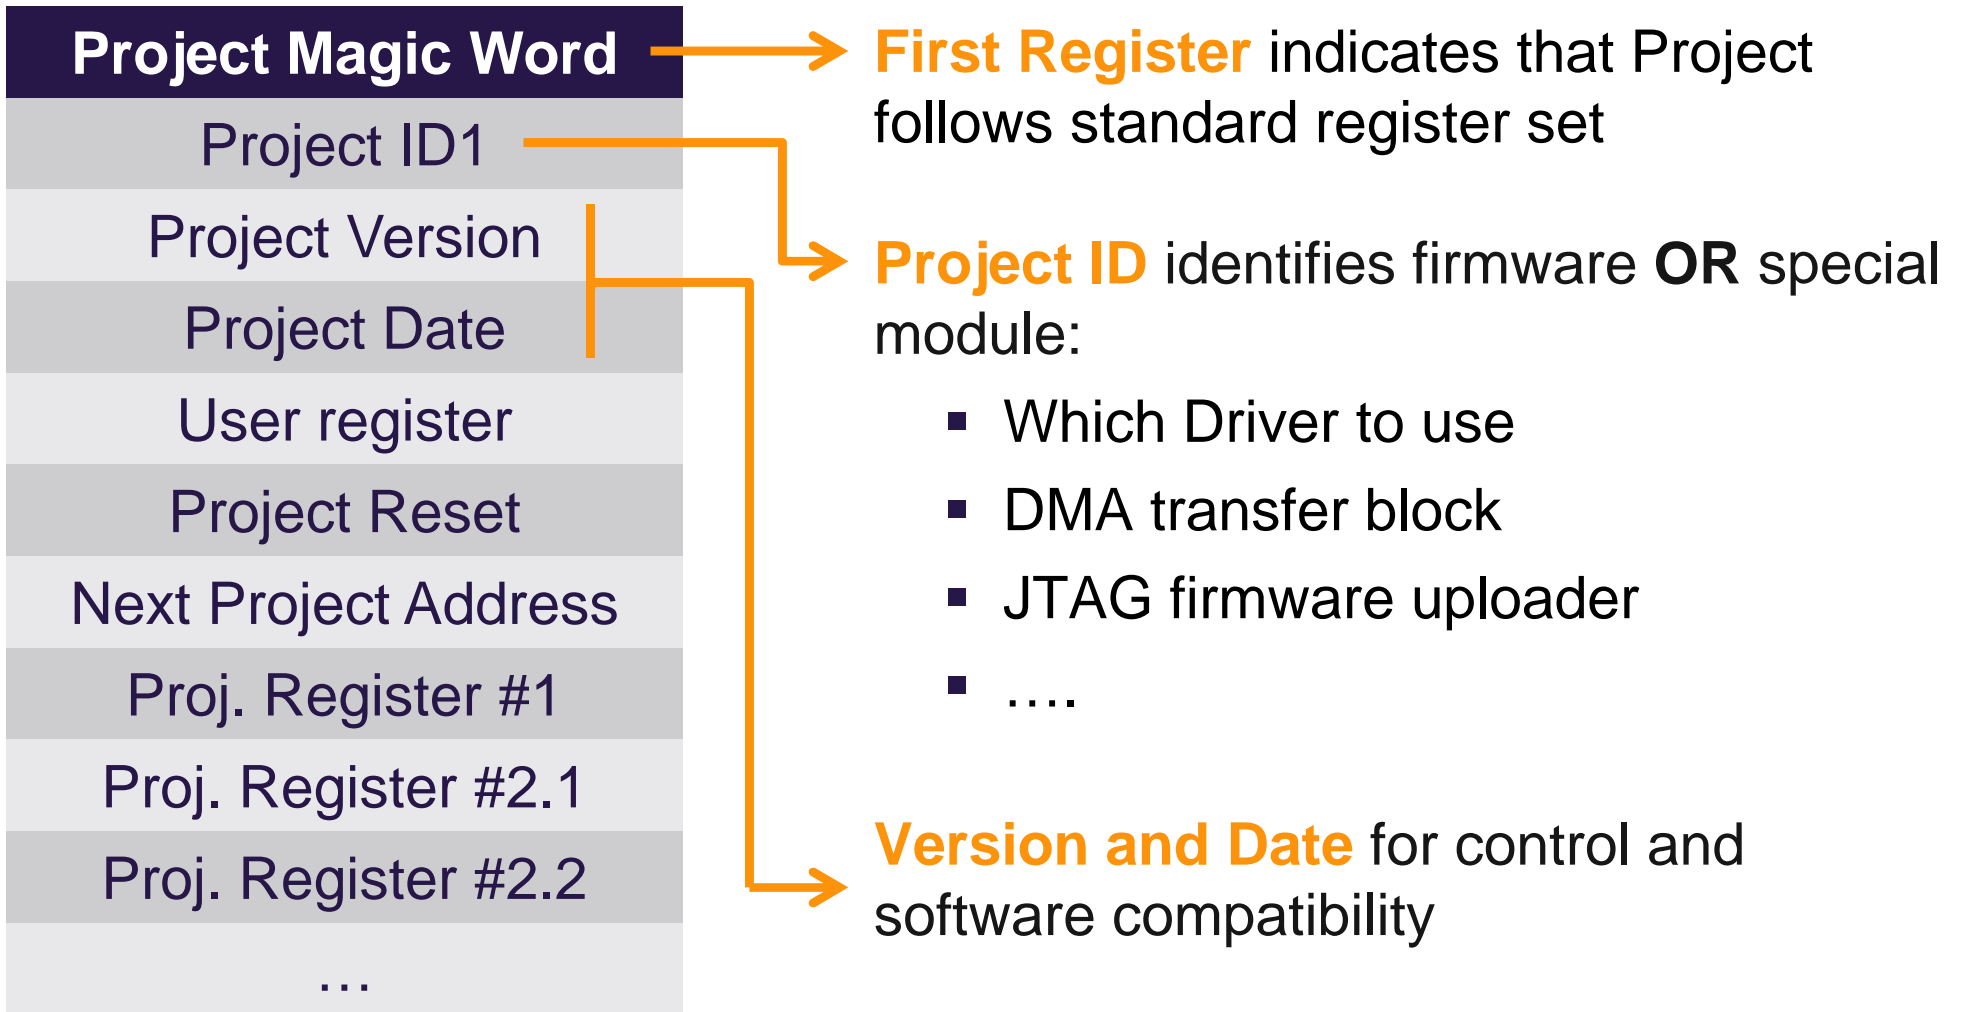

Board Magic Word
Board ID
RESERVED #1
RESERVED #2
HW Version
RESERVED #3
First Project Address

Standard registers
for each **Project**

Project Magic Word
Project ID1
Project Version
Project Date
User register
Project Reset
Next Project Address

Board Standard register Set

Project Magic Word

Project ID1

Project Version

Project Date

User register

Project Reset

Next Project Address

Proj. Register #1

Proj. Register #2.1

Proj. Register #2.2

...

→ **Soft Reset of Project** – reset of state machines and not configurations

→ Registers that are implemented by developer/vendor (optional)

Addresses of Projects

Board Magic Word
Board ID
RESERVED #1
RESERVED #2
HW Version
RESERVED #3
First Project Address

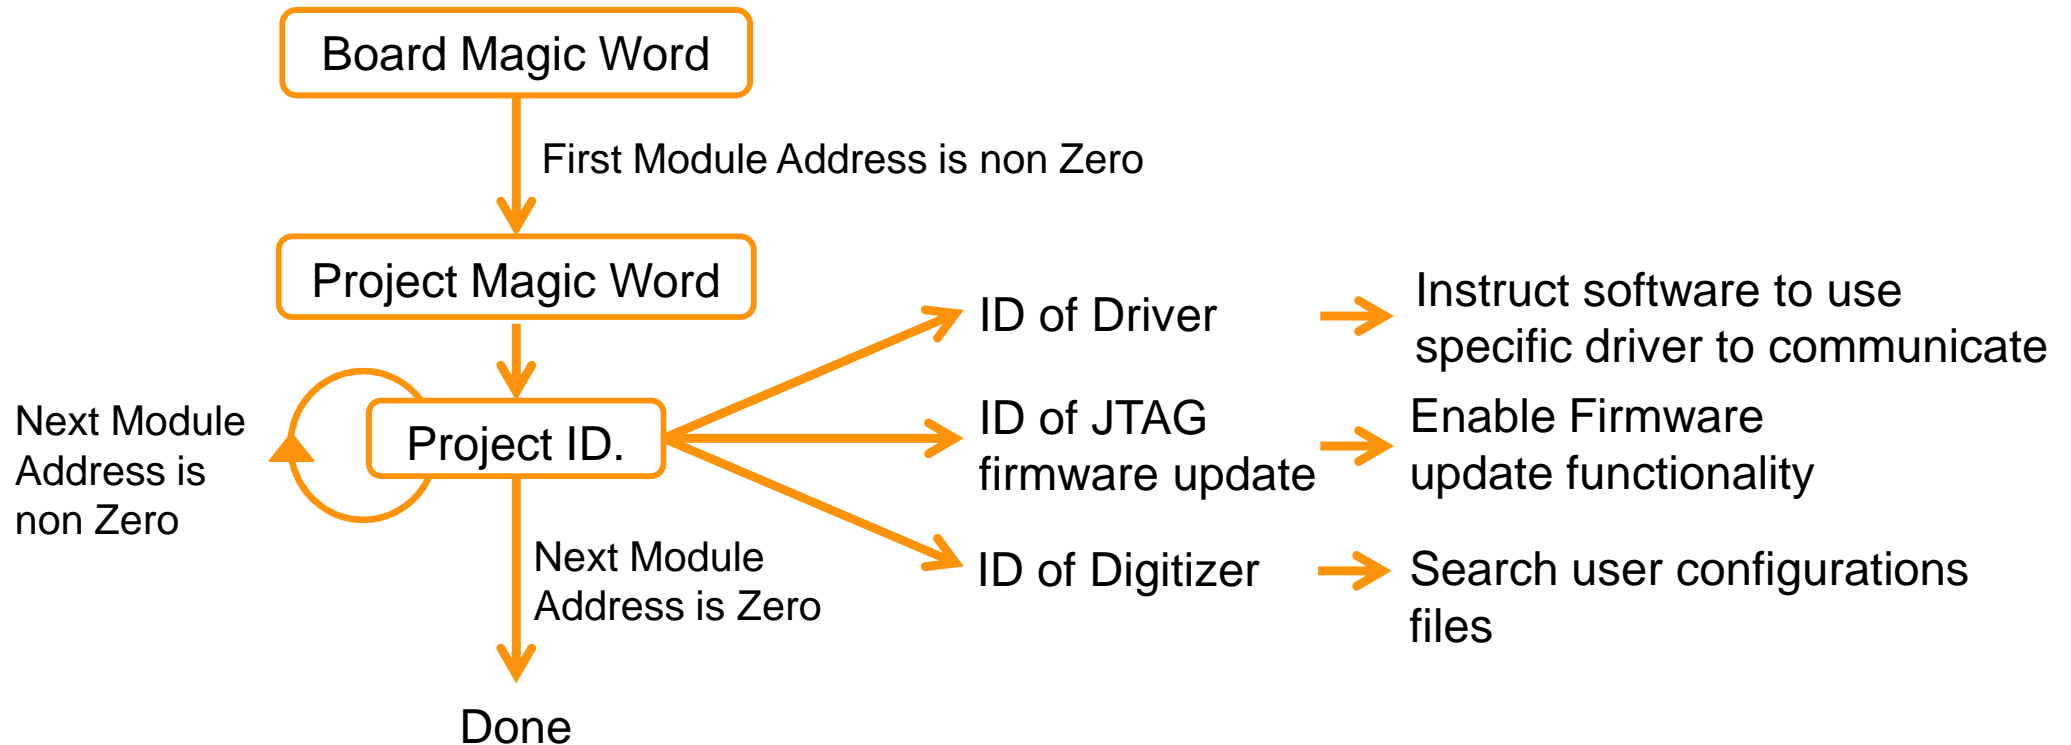

Absolute Offset to first module

Project Magic Word
Project ID1
Project Version
Project Date
User register
Project Reset
Next Project Address
Project User Register #1
Project User Register #2
....

Value Zero – no more modules

Value non Zero – absolute offset to next module

- Mapping of all Projects defined on the Device
- Search Project configuration file (based on version and driver name)
- Software functionalities are activated only when certain projects are present in the device

The **SHAPI Design Guide** will convey ideas already in use in different institutions:

- Device and Modules structure
- Register with (relative) addresses to Modules
- Unique group that will assign Device/Standard Modules IDs
 - Online information (manuals/guides/contacts)
- Standard set of Device/Module capabilities
- Standard set to deal with Interrupts
