# Two-loop conformal anomaly in QCD

## A. N. Manashov

# Hamburg University

#### based on

- V. Braun, A. Manashov, Eur. Phys. J. C 73 (2013) 2544
- V. Braun, A. Manashov, Phys. Lett. B 734 (2014) 137
- V. Braun, A. Manashov, S. Moch, M. Strohmaier, in progress

DESY, 1.10.2015

#### Motivation

- DIS: Structure functions: scale dependence is governed by anomalous dimensions of twist-2 operators (known at three loops), Larin, Vermaseren, Moch, Vogt, et al)
- ◆ Deeply Virtual Compton Scattering: (Müller, Ji, Radyushkin) Generalized Parton
   Distributions: scale dependence ←→ anomalous dimension matrix (nonforward kernel)
   (two loops) Belitsky, Müller, (2000)

Explore the road to NNLO (three-loop) evolution equations for GPDs

One loop: anomalous dimensions+conformal symmetry $\rightarrow$  full anomalous dimension matrix. (Makeenko, 1980)

$$O_N \sim \left(\partial_{z_1} + \partial_{z_2}\right)^N C_N^{3/2} \left( \frac{\partial_{z_1} - \partial_{z_2}}{\partial_{z_1} + \partial_{z_2}} \right) \, \bar{q}(z_1 n) \gamma_+ q(z_2 n)$$

In any realistic d=4 QFT the conformal symmetry is broken,  $\beta(g)\neq 0$ .

D. Müller, Constraints for anomalous dimensions of local light cone operators in  $\phi^3$  in six-dimensions theory, Z. Phys. C 49 (1991) 293.

( Conformal Ward Identities, Conformal anomaly, Conformal scheme, etc )

Belitsky, Müller, (2000) two loop kernels in QCD.

#### Difference to D.Müller:

Instead of considering consequences of broken conformal symmetry in QCD we make use of exact conformal symmetry of a modified theory: Large  $N_f$  QCD in  $4-2\epsilon$  dimensions at critical coupling: Banks, Zaks, 82

$$\beta^{QCD}(a) = 2a \left[ -\epsilon - \beta_0 a + \dots \right] \qquad a_* = -4\pi \epsilon / \beta_0 + \dots \qquad \beta^{QCD}(a_*) = 0$$

$$a_* = a_*(\epsilon) \qquad \longleftrightarrow \qquad \epsilon = \epsilon(a_*)$$

 $1/N_f$  expansion, Gracey, Cuccini, Derkachov, A.M.

#### Premium:

- Exact symmetry ⇒ algebraic group-theory methods
- ullet Answer obtained directly in  $\overline{\mathrm{MS}}$  scheme
- Light-ray operator basis, do not need to restore evolution eqs. from local operators.

$$\begin{split} \mathcal{O}(x;z_1,z_2) &\equiv [\bar{q}(x+z_1n)\not n q(x+z_2n)] \equiv \sum_{m,k} \frac{z_1^m z_2^k}{m!k!} [(D_+^m \bar{q})(x)\not n (D_+^k q)(x)] \\ &= \sum_{N,k} \Psi_{Nk}(z_1,z_2)\, \partial_+^k \mathcal{O}_N(x) \end{split}$$

### Collinear Subgroup

$$p_{+} = \frac{1}{\sqrt{2}}(p_{0} + p_{z}) \to \infty$$

$$p_{-} = \frac{1}{\sqrt{2}}(p_{0} - p_{z}) \to 0$$

$$px \to p_{+}x_{-}$$

Special conformal transformation

$$x_{-} \to x'_{-} = \frac{x_{-}}{1 + 2ax_{-}}$$

- translations  $x_- \to x'_- = x_- + c$
- dilatations  $x_- \to x_-' = \lambda x_-$

form the so-called **collinear subgroup** SL(2,R)

$$\alpha \to \alpha' = \frac{a \alpha + b}{c \alpha + d}, \quad ad - bc = 1$$

$$\Phi(\alpha) \to \Phi'(\alpha) = (c \alpha + d)^{-2j} \Phi\left(\frac{a\alpha + b}{c\alpha + d}\right)$$

where  $\Phi(x)\to\Phi(x_-)=\Phi(\alpha n_-)$  is the quantum field with scaling dimension  $\ell$  and spin projection s "living" on the light-ray

Conformal spin:

$$j = (l+s)/2$$

Light-ray operators satisfy the RG equation

Balitsky, Braun '89

$$\left(M\partial_M + \beta(a)\partial_a + \mathbb{H}\right)\mathcal{O}(z_1, z_2) = 0$$

where  ${\mathbb H}$  is an integral operator acting on the light-cone coordinates of the fields:

$$\mathbb{H}\mathcal{O}(z_1, z_2) = \int_0^1 d\alpha \int_0^1 d\beta \, h(\alpha, \beta) \, \mathcal{O}(z_{12}^{\alpha}, z_{21}^{\beta})$$
 
$$\frac{z_{12}^{\alpha} \equiv z_1 \bar{\alpha} + z_2 \alpha}{\bar{\alpha} = 1 - \alpha}$$

$$h(\alpha,\beta) = a h^{(1)}(\alpha,\beta) + a^2 h^{(2)}(\alpha,\beta) + \dots$$
 [does not depend on  $\epsilon$ ]

One can show that the powers  $\mathcal{O}(z_1,z_2)\mapsto (z_1-z_2)^N$  are eigenfunctions of  $\mathbb{H}$ , and the corresponding eigenvalues are the anomalous dimensions of local operators of spin N (with N-1 derivatives)

$$\gamma_N = \int d\alpha d\beta \, h(\alpha, \beta) (1 - \alpha - \beta)^{N-1}$$
 (NNLO)

Is it possible to restore  $h(\alpha, \beta)$  from  $\gamma_N$ ?

### Symmetries beyond leading order

It is expected that the evolution kernel  $\mathbb H$  commutes with the generators of SL(2,R) collinear subgroup,  $[S_{\alpha},\mathbb H]=0$ ,  $\alpha=\pm,0$ .

Leading order generators

$$S_{+}^{(0)} = z_1^2 \partial_{z_1} + z_2^2 \partial_{z_2} + 2(z_1 + z_2), \quad S_{0}^{(0)} = z_1 \partial_{z_1} + z_2 \partial_{z_2} + 2, \quad S_{-}^{(0)} = -\partial_{z_1} - \partial_{z_2} \partial_{z_2} + 2,$$

Exact conformal symmetry, but the generators are modified by quantum corrections

$$S_{-} = S_{-}^{(0)},$$

$$S_{0} = S_{0}^{(0)} - \epsilon(a_{*}) + \frac{1}{2}\mathbb{H}(a_{*}), \qquad \mathbb{H}(a_{*}) = a_{*}\mathbb{H}^{(1)} + \dots$$

$$S_{+} = S_{+}^{(0)} + (z_{1} + z_{2})\left(-\epsilon(a_{*}) + \frac{1}{2}\mathbb{H}(a_{*})\right) + (z_{1} - z_{2})\Delta_{+}(a_{*}),$$

$$\mathcal{O}(x;z_1,z_2) = \sum_{N,l} \Psi_{Nk}(z_1,z_2) \, \partial_+^k \mathcal{O}_N(x), \qquad \qquad \mathbb{H}(a_*) \Psi_{Nk} = \gamma_N \, \Psi_{Nk}$$

### Symmetries beyond leading order

$$\mathbb{H}(a_*)$$
 commutes with all generators  $\Longrightarrow \mathbb{H}(a_*) = f(J)$ 

$$J(J-1) = S_{+}S_{-} + S_{0}(S_{0}-1)$$

The lowest eigenfunctions are known:  $\Psi_{N0}(z_1,z_2)=z_{12}^N$  (for any coupling).

$$J(a_*)z_{12}^N = (N+2-\epsilon+\gamma_N/2)z_{12}^N,$$
  $\mathbb{H}(a_*)z_{12}^N = \gamma_N z_{12}^N$ 

$$\gamma_N = f(N+2-\epsilon+\gamma_N/2).$$

One can restore the function f from anomalous dimensions:  $f(x) = a f_1(x) + a^2 f_2(x) + \dots$ 

$$\mathbb{H}(a) = a f_1(J(a)) + a^2 f_2(J(a)) + a^3 f_3(J(a)) + \dots$$

## Conformal Ward Identity $\longmapsto \Delta_+$

Expansion over conformal operators

$$\mathcal{O}^{(n)}(x; z_1, z_2) = \sum_{N,k} \Psi_{Nk}(z_1, z_2) \, \partial_+^k \mathcal{O}_N^{(n)}(x),$$

Conformal symmetry at the critical coupling implies

$$\left(S_{+}^{(z)} - \frac{1}{2}x^{2}(\bar{n}\partial_{x})\right) \left\langle \mathcal{O}_{n}(0, z_{1}, z_{2}), \mathcal{O}_{\bar{n}}(x, w_{1}, w_{2}) \right\rangle = 0$$
  $(nx) = (\bar{n}x) = 0$ 

• To find explicit expression for  $S_+$ , consider Ward identity ( $\delta_+ = \mathbf{K}\bar{n}$ )

$$\left\langle \delta_{+} \mathcal{O}^{(n)}(z) \, \mathcal{O}^{(\bar{n})}(x,w) \right\rangle + \left\langle \mathcal{O}^{(n)}(z) \, \delta_{+} \mathcal{O}^{(\bar{n})}(x,w) \right\rangle = \left\langle \delta_{+} S_{R} \, \mathcal{O}^{(n)}(z) \, \mathcal{O}^{(\bar{n})}(x,w) \right\rangle$$

Then

$$\delta_{+}\mathcal{O}^{(\bar{n})}(x; w_{1}, w_{2}) = -x^{2}(\bar{n}\partial_{x})\mathcal{O}^{(\bar{n})}(x; w_{1}, w_{2}) 
\delta_{+}\mathcal{O}^{(n)}(0; z_{1}, z_{2}) = 2(n\bar{n})\left(S_{+}^{(0)} - \epsilon(z_{1} + z_{2}) - \frac{a}{2}[\mathbb{H}^{(1)}, z_{1} + z_{2})] + \cdots\right)\mathcal{O}^{(n)}(0; z_{1}, z_{2})$$

and for the last term

$$\delta_{+}S^{QCD} = 4\epsilon \int d^dx (x\bar{n}) L^{QCD} + 2(d-2)\bar{n}^{\mu} \int d^dx \, \delta_{BRST}(\bar{c}^a A_{\mu}^a). \label{eq:delta_QCD}$$

$$\left\langle \mathcal{O}^{(n)}(0;z_1,z_2)q(x)\bar{q}(y)\right\rangle$$
 – bad object for an analysis

### Conformal Ward Identity $\longmapsto \Delta_+$

ullet Reexpand  $\epsilon L$  in terms of renormalized operators

$$2\epsilon L = -\beta(a)/a \left[L^{YM+gf}\right] + EOM + BRST$$

$$[\beta(a_*)=0]$$

$$\Delta S_+ \langle \mathcal{O}_n(0,z), \mathcal{O}_{\bar{n}}(x,w) \rangle = KR' \left( \langle \int d^D y(\bar{n}y) L^{YM+gf}(y) \mathcal{O}_n(0,z), \mathcal{O}_{\bar{n}}(x,w) \rangle \right)_{\text{SIMPLE RESIDUE IN } \epsilon}$$

One loop: A. Belitsky, D. Müller, 2001, (V. Braun, A.M., (2014))

$$\Delta_{+}^{(1)}\mathcal{O}(z_{1},z_{2}) = -2C_{F}\int_{0}^{1}du\int_{0}^{1}d\alpha \frac{\bar{\alpha}}{\alpha}\Big[\mathcal{O}(z_{12}^{ulpha},z_{2}) - \mathcal{O}(z_{1},z_{21}^{ulpha})\Big]$$

#### two loops:

$$\begin{split} [\Delta_{+}^{(2)}\mathcal{O}](z_{1},z_{2}) &= \int_{0}^{1} d\alpha \int_{0}^{\bar{\alpha}} d\beta \Big[ \omega(\alpha,\beta) + \omega^{\mathbb{P}}(\alpha,\beta) \mathbb{P}_{12} \Big] \Big[ \mathcal{O}(z_{12}^{\alpha},z_{21}^{\beta}) - \mathcal{O}(z_{12}^{\beta},z_{21}^{\alpha}) \Big] \\ &+ \int_{0}^{1} du \int_{0}^{1} d\alpha \,\varkappa(\alpha) \, \Big[ \mathcal{O}(z_{12}^{u\alpha},z_{2}) - \mathcal{O}(z_{1},z_{21}^{u\alpha}) \Big]. \end{split}$$

Color structures;  $\beta_0 C_F$ ,  $C_F^2$  and  $C_F C_A$ :  $(\tau = \alpha \beta / \bar{\alpha} \bar{\beta})$ 

$$\begin{split} \omega_{FF}(\alpha,\beta) &= 4 \left[ \left( \alpha - \frac{1}{\alpha} \right) \left[ \operatorname{Li}_2 \left( \frac{\beta}{\bar{\alpha}} \right) - \operatorname{Li}_2(\beta) - \operatorname{Li}_2(\alpha) - \frac{1}{4} \ln^2 \bar{\alpha} \right] - \alpha \left[ \operatorname{Li}_2(\alpha) - \operatorname{Li}_2(1) \right] \right. \\ &\qquad \qquad - \frac{\alpha + \beta}{2} \ln \alpha \ln \bar{\alpha} + \frac{1}{4} \left[ \beta \ln^2 \bar{\alpha} - \alpha \ln^2 \alpha \right] - \frac{\alpha}{\tau} \left[ \tau \ln \tau + \bar{\tau} \ln \bar{\tau} \right] \\ &\qquad \qquad + \frac{1}{4} \left[ \beta - 2\bar{\alpha} + \frac{2\beta}{\alpha} \right] \ln \bar{\alpha} + \frac{1}{2} \left[ \bar{\alpha} - \frac{\alpha}{\bar{\alpha}} - 3\beta \right] \ln \alpha - \frac{15}{4} \alpha \right], \\ \omega_{FA}(\alpha,\beta) &= 2 \left[ \left( \frac{1}{\alpha} - \alpha \right) \left[ \operatorname{Li}_2 \left( \frac{\beta}{\bar{\alpha}} \right) - \operatorname{Li}_2(\beta) - 2 \operatorname{Li}_2(\alpha) - \ln \alpha \ln \bar{\alpha} \right] + \frac{\alpha}{\tau} \left[ \tau \ln \tau + \bar{\tau} \ln \bar{\tau} \right] \right. \\ &\qquad \qquad - \bar{\beta} \ln \alpha - \frac{\bar{\alpha}}{\alpha} \ln \bar{\alpha} \right], \\ \omega_{FF}^{\mathbb{P}}(\alpha,\beta) &= -4 \left[ \left( \bar{\alpha} - \frac{1}{\bar{\alpha}} \right) \left[ \operatorname{Li}_2 \left( \frac{\alpha}{\bar{\beta}} \right) - \operatorname{Li}_2(\alpha) - \ln \bar{\alpha} \ln \bar{\beta} \right] + \alpha \bar{\tau} \ln \bar{\tau} + \frac{\beta^2}{\bar{\beta}} \ln \bar{\alpha} \right] \end{split}$$

#### Conclusions

- QCD evolution equations possess a "hidden" conformal symmetry
- ullet n-loop evolution kernels for twist-two operators in MS scheme can be restored from the (n-1)-loop calculation of the special conformal anomaly and n-loop anomalous dimensions
- $\bullet$  SL(2) symmetry properties manifest in the light-ray operator representation
