

Discovering Displaced Higgs Portal Dark Matter at the LHC

Wednesday 30 September 2015 17:05 (15 minutes)

We revisit the singlet complex scalar Higgs portal model. We introduce the $U(1)_{\phi}$ breaking terms. These terms make small mass splitting. The small mass splitting make the displaced decay which could be a non-SM background signal. We find feasible way to discover the displaced higgs portal dark matter at the LHC.
