

XXIV International Workshop on Deep-Inelastic Scattering and Related Subjects (DIS16)

Contribution ID: 205

Type: **not specified**

The gluon Sivvers asymmetry measurements at COMPASS

Tuesday, 12 April 2016 15:20 (15 minutes)

The Sivvers effect describes the correlation between the spin of the nucleon and the orbital motion of partons. For gluons it has been measured at COMPASS via J/Ψ production and via high- p_T hadron pair production in Semi-Inclusive Deep Inelastic Scattering of a 160 GeV/c muon beam off transversely polarised proton and deuteron targets by determining the amplitude of the modulation of the Sivvers angle ϕ^{Siv} distribution. Both the approach using J/Ψ channel and high- p_T hadron pair selection will be described in detail and the results given.
