

Open Standards for Embedded Computing

An Introduction to the PICMG Standards Organization

Agenda

- Do we need open standards?
- Who is PICMG?
- Major PICMG technologies
- Work involved in making a new standard
- Which standards are to come tomorrow?

Do we need open standards?

- 2 main questions:
 - “make” vs. “buy”
 - “proprietary” vs. “open”
- ✓ Supporters
- ✓ Time to market
- ✓ Costs

Proprietary Architectures

- Typically developed, built, and maintained by a single vendor – a complete solution
- Generally expensive and rarely the latest technology
- Only the largest companies have all of the requisite skills to be experts on all elements
- Upgrades usually slow to arrive – the vendor “owns” you

Open Architectures

- Open standards generally developed by non-profit consortia with many members that have a wide range of skills
- Multiple vendors provide price and feature competition
- If customers don't like their vendor(s) they can go someplace else
- Leading edge technology and improvements

Do we need open standards?

- 2 main questions:
 - “make” vs. “buy”
 - “proprietary” vs. “open”

- ✓ Supporters
- ✓ Time to market
- ✓ Costs

✓ YES, we do!

Agenda

- Do we need open standards?
- Who is PICMG?
- Major PICMG technologies
- Work involved in making a new standard
- Which standards are to come tomorrow?

PICMG®

- Formal name: PCI Industrial Computer Manufacturers Group
- Pronounced “Pick-M-G” or “Pick-Mig”
- Founded 1994
- Non-profit consortium
- Over 250 members companies
- 45 standards released to date, grouped in 9 families, representing more than \$10B in global revenue

PICMG®

- Hundreds of vendors building compliant, interoperable products
- Deep engineering expertise in member companies:
 - Electronic, mechanical, packaging, and thermal design
 - High speed signaling and simulation
 - Software and High Availability skills
- Rigorous Intellectual Property policies
- Long technology lifetimes (>20 years) with continuous improvement

Agenda

- Do we need open standards?
- Who is PICMG?
- Major PICMG technologies
- Work involved in making a new standard
- Which standards are to come tomorrow?

CompactPCI®

CompactPCI Serial®

- CompactPCI®:
 - Adoption 1995
 - first switched fabric backplane in 2000
- CompactPCI Serial®:
 - Adoption 2011
 - high speed serial fabrics (GbE, PCIe, USB, SATA)
- Popular and rugged 3U/6U Eurocard mechanics
- Used in a wide variety of industrial control telecommunications, transportation and automation applications

COM Express®

- Adoption 2004
- small single board computer “engines”
- Variety of sizes supported
- Very popular high performance Small Form Factor architectures
- Can be plugged into a customer-supplied baseboard containing application specific I/O

Advanced TCA[®]

- Adoption 2003
- aka ATCA[®]: now the global standard for high end telecom equipment
- Modular, rugged, NEBS compliant
- Architected for High Availability – system keeps running in the event of single item failures. ATCA is the only open architecture to offer this
- Global revenue greater than \$2B USD/year
- VITA adopting ATCA Platform Management architecture for VITA 46 (VPX) with PICMG's blessing.

Advanced TCA[®] SpinOffs

- **Advanced Mezzanine Card (AdvancedMC[®])**
 - Adoption 2004
 - Allows customizing ATCA cards for application specific I/O, reducing spares inventories for telecom carriers
 - Fully managed, supporting High Availability
- **MicroTCA[®]**
 - Adoption 2006
 - Utilizes AdvancedMC cards plugged directly into a backplane
 - Supports High Availability designs
 - multi-facted and rich ecosystem
 - Small-to-large migration path

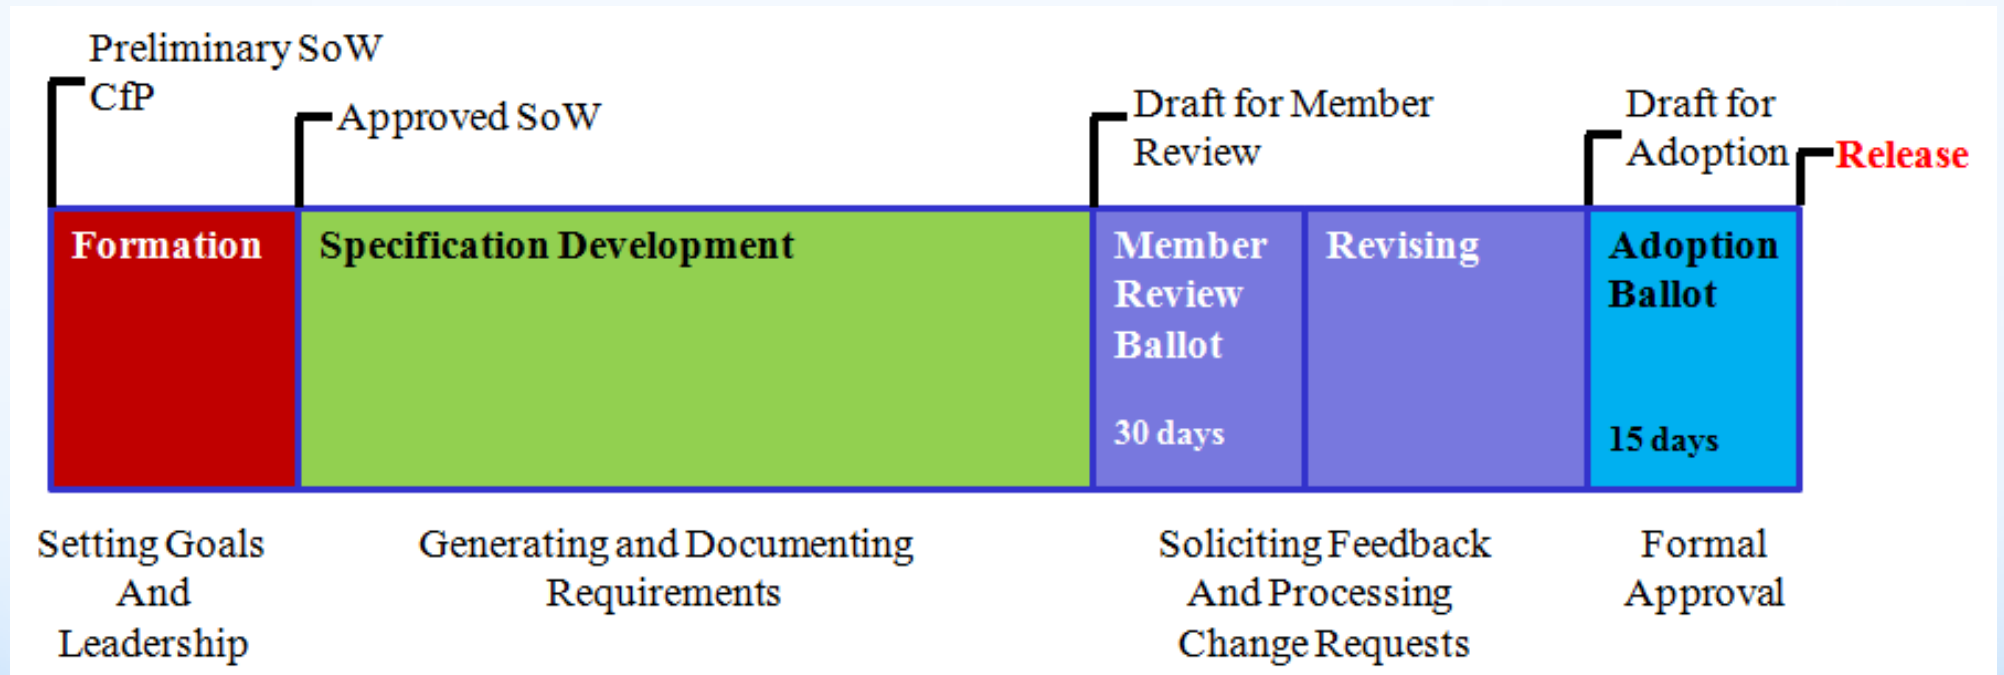

Agenda

- Do we need open standards?
- Who is PICMG?
- Major PICMG technologies
- Work involved in making a new standard
- Which standards are to come tomorrow?

Work involved in a new standard

Work involved in a new standard

Agenda

- Do we need open standards?
- Who is PICMG?
- Major PICMG technologies
- Work involved in making a new standard
- Which standards are to come tomorrow?

Evolution and Revolution

- PICMG has developed roadmaps for the future of key technologies:
 - AdvancedTCA: add 100G backplane bandwidth, improved cooling, higher power capability, SDN and NFV, improved applicability for data centers (PICMG 3.7)
 - MicroTCA: add 40G backplane bandwidth
 - GEN4™ - a next generation platform with 10x system and module throughput, improved SWaP, reduced CAPEX & OPEX. Improved scalability and recognition of convergence of telecom central office and data center requirements.

Conclusion

- PICMG well established with significant track record of successful standards
- Extremely talented and diverse member base
- Strong Intellectual Property policies
- Low membership dues and not dominated by any single company
- Continuing evolution of key technologies

Thank you!
