

## Searches for point-like neutrino sources with the ANTARES neutrino telescope

*Thursday 17 March 2016 10:50 (20 minutes)*

ANTARES is the largest undersea neutrino telescope currently on operation. This telescope has been in continuous operation since 2007 with the aim to detect neutrinos from astrophysical sources. A review of the point-like neutrino sources with the ANTARES telescope will be shown. On one hand, the latest results of the all-flavour neutrino point-source analysis with data from 2007 to 2013 will be described. The results of the first combined ANTARES and IceCube analysis will also be given.
