① Project description

② System architecture

③ Tests

④ Outlook

Briefly

Setup MTCA.4-based single cavity regulation system at the ELBE facility.

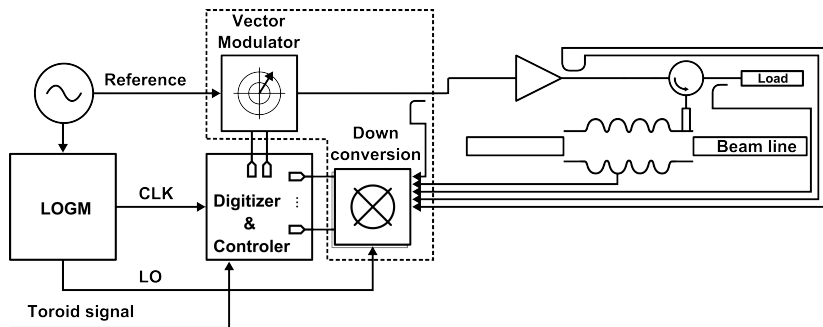

Goals

- Prepare a robust solution for the CW operation.
- Develop a MTCA.4-based LLRF control system suitable for external users.
- Minimize the maintenance effort needed.
- Increase the flexibility.

Real-time FB Loop Overview

Hardware platform

Control loop - main components (per cavity)

- DRTM-DWC8VM1 / DRTM-DS8VM1
- Struck SIS8300L2

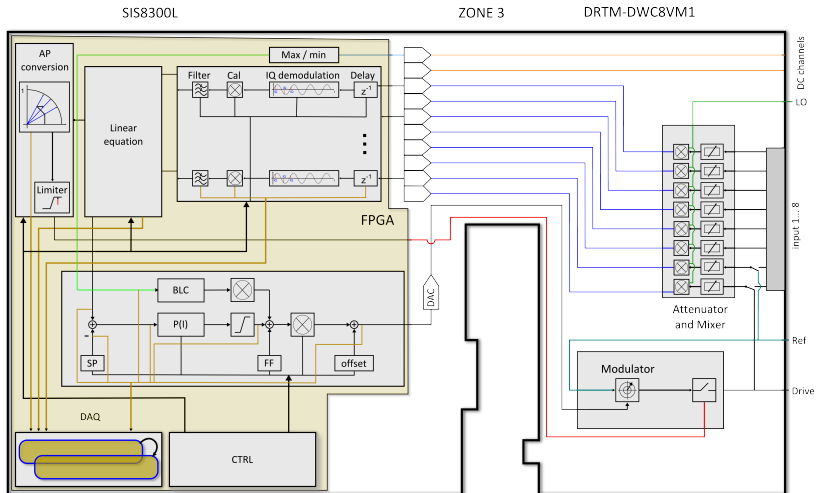

Other components

- MTCA.4 Crate
- CPU
- Power Supply
- Timing module
- MCH

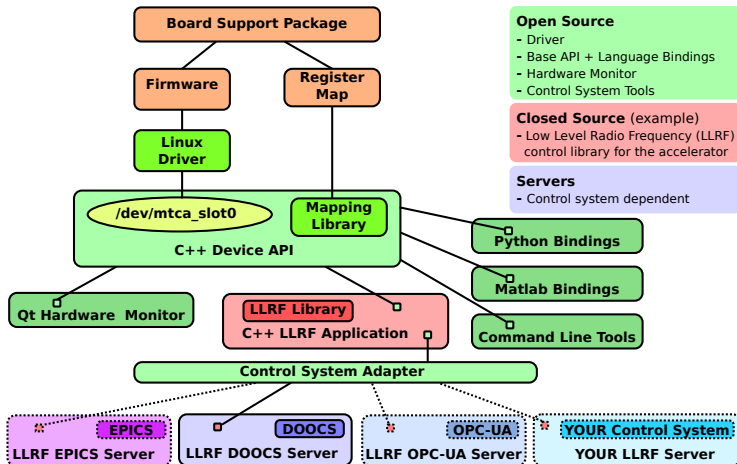

External

- LO Generation Module (LOGM)
- ICT signal conditioning front-end
- Timing system

Firmware

Software

Courtesy of Martin Killenberg.

- ② System architecture
- ③ Tests**
- ④ Outlook

Test runs

November 2013

- First experience
- Integration issues (Timing)
- Cavity 3 and 4

2014

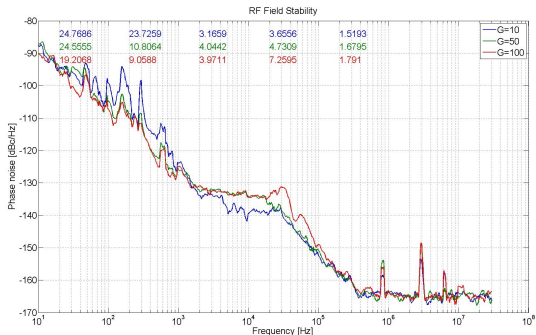

- Cavity 1 and 2
- 260 MHz buncher
- Performance optimization

Gradient: $10.5 \frac{MV}{m}$

Beam current: 800 μA

Gain (A.U.)	Jitter (fs)
10	34.67
50	27.59
100	22.86

Reference jitter : 21.2 fs

Test runs (cont.)

2015

- Real-time BLC
- Automation (server, close loop ramp up procedure)
- Focus on the system integration

Common problems

- Phase Alignment
- Warm and Cold Windows Interlock
- Timing signal
- MTCA management and OS configuration (RTM CPU issues)

Small mistake with big consequences (Nov 9th 2015)

- Error in communication
- Wrong gradient
- Beam on (CW)
- Below beam loss interlock threshold
- Vacuum broken

- ① Project description
- ② System architecture
- ③ Tests
- ④ Outlook

Most important todos

- Control system adaptor
- Interlock integration
- Timing
- UNILOGM (Q1 2016)

Other tasks

- DAQ
- Real-time BLC
- New diagnostic and automation

Questions

Backup slide - BLC
