

De Sitter vacua with two axions

Wednesday 24 February 2016 14:45 (15 minutes)

We first describe in general terms how to derive Minkowski or de Sitter vacua from $N=1$ SUGRA with two axions. Then we discuss a possible embedding in a 6D flux compactification model with two axions involved in a Green-Schwarz mechanism that cancels an anomaly related to a $U(1)$ flux which breaks SUSY at a high scale.

Presenter: DIERIGL, Markus (DESY)
