

SUSY DM predictions for Direct Detection Experiments, the LHC and the ILC

Tuesday 21 June 2016 10:45 (25 minutes)

We perform a fit of various SUSY models (with a WIMP DM candidate) to experimental data from LHC searches, astrophysical data, low-energy and flavor observables. Based on this analysis we give predictions for the prospects of Direct Detection experiments, ongoing LHC searches and future ILC searches. We stress the complementarity of the various searches to determine the nature of DM.
