

Recent Progress in Neutrino Physics

Wednesday 22 June 2016 09:00 (35 minutes)

Neutrino is one of the most abundant constituents of the Universe. Yet, its weakly interacting nature poses a challenge to the studies of its properties. Progress was slow until the recent discoveries of neutrino oscillation. At the center stage is the issue of the neutrino mass. In this talk, the recent progress and prospects of our quest for understanding the neutrino mass will be presented.
