Chiral quark models used in similar studies by the Bochum, Valencia, and Jagellonian groups

Basics

Chiral quark models

- soft regime \rightarrow chiral sym. breaking
- NJL (Nobel 2008), instanton liquid, DSE
- relatively few parameters (traded for f_{π}, m_{π}, \dots)
- very many processes can be computed!
- no confinement careful not to open the $q\overline{q}$ threshold
- low quark-model scale $\sim 320-500~{\rm MeV}$ need for evolution
- local and non-local (instanton-based) models

Photon DA's: definitions

Twist-2 components of the photon Distribution Amplitude [Ali+Braun 95, Ball+Braun 96-]

$$\begin{aligned} \langle 0 | \overline{q}(z) \sigma_{\mu\nu}[z, -z] q(-z) | \gamma^{\lambda}(q) \rangle &= \\ & i e_q \langle \overline{q}q \rangle \chi_{\mathrm{m}} f_{\perp\gamma}^t \left(q^2 \right) \left(\epsilon_{\perp\mu}^{(\lambda)} p_{\nu} - \epsilon_{\perp\nu}^{(\lambda)} p_{\mu} \right) \int_0^1 dx e^{i(2x-1)q \cdot z} \phi_{\perp\gamma}(x, q^2) + h.t. \\ \langle 0 | \overline{q}(z) \gamma_{\mu}[z, -z] q(-z) | \gamma^{\lambda}(q) \rangle &= \\ & e_q f_{3\gamma} f_{\parallel\gamma}^v \left(q^2 \right) p_{\mu} \left(\epsilon^{(\lambda)} \cdot n \right) \int_0^1 dx e^{i(2x-1)q \cdot z} \phi_{\parallel\gamma}(x, q^2) + h.t. \\ \langle 0 | \overline{q}(z) \gamma_{\mu} \gamma_5[z, -z] q(-z) | \gamma^{\lambda}(q) \rangle &= h.t. \end{aligned}$$

where

 $e^{(\lambda)} \cdot q = 0, \ \epsilon^{(\lambda)} \cdot n = 0 \text{ for real photons}$ $p_{\mu} = q_{\mu} - \frac{q^2}{2} n_{\mu}, \ n_{\mu} = \frac{z_{\mu}}{p \cdot z}, \ e^{(\lambda)}_{\mu} = \left(e^{(\lambda)} \cdot n\right) p_{\mu} + \left(e^{(\lambda)} \cdot p\right) n_{\mu} + e^{(\lambda)}_{\perp \mu}$

Definitions Results QCD evolution Pion-photon TDA

Quark-model evaluation

Photon/ ρ -to-current transition:

We have used

- Non-local quark model (instanton-based), with Gaussian regulator
- NJL model with PV subtraction
- Spectral Quark model (SQM), implementing the VMD

Definitions Results QCD evolution Pion-photon TDA

Constants

QCD predicts the scale dependence for the quark condensate $\langle 0 | \overline{q}q | 0 \rangle$, its magnetic susceptibility $\chi_{\rm m}$, and for $f_{3\gamma}$. At LO

$$\begin{aligned} \langle 0 | \overline{q}q | 0 \rangle |_{\mu} &= L^{-\gamma \overline{q}q/b} \langle 0 | \overline{q}q | 0 \rangle |_{\mu_0} \\ \chi_m |_{\mu} &= L^{-(\gamma_0 - \gamma \overline{q}q)/b} \chi_m |_{\mu_0}, \quad f_{3\gamma} |_{\mu} = L^{-\gamma_f/b} f_{3\gamma} |_{\mu_0} \end{aligned}$$

where $r = \alpha_s (\mu^2) / \alpha_s (\mu_0^2)$, $b = (11N_c - 2n_f) / 3$, $\gamma_{\overline{q}q} = -3C_F$, $\gamma_0 = C_F$, $\gamma_f = 3C_A - C_F / 3$, with $C_F = 4/3$ and $C_A = 3$ for $N_c = 3$.

| quantity at 1 GeV | non-local | SQM | QCD s.r. | VMD |
|---|-----------|---------|----------------------|---------|
| $(-\langle 0 \left \overline{q}q \right 0 \rangle)^{1/3}$ [GeV] | 0.24 | 0.24 | 0.24 ± 0.02 | - |
| $\chi_m \; [{ m GeV}^2]$ | 2.73 | 1.37 | 3.15 ± 0.3 | 3.37 |
| $f_{3\gamma}$ [GeV $^{-2}$] | -0.0035 | -0.0018 | -0.0039 ± 0.0020 | -0.0046 |

SQM similar to NJL, local models have larger r than the non-local model QCD s.r. and VDM from [Braun+Ball+Kivel 03]

Definitions Results QCD evolution Pion-photon TDA

Form factors

- Local models very similar
- Typical fall-off scale of $\sim m_{\rho}$
- In SQM

$$f^{t,{\rm SQM}}_{\perp\gamma}(q^2) = \frac{m_\rho^2}{m_\rho^2+q^2}$$

(日) (同) (目) (日)

Definitions **Results** QCD evolution Pion-photon TDA

Photon DA's

- $\phi_{\perp\gamma}(x,q^2=0)=1$ in local models
- $\bullet \ \sim 1$ in non-local models
- For virtual photon SQM gives simple formulas:

$$\phi_{\parallel\gamma^*}(x,q^2) = \frac{1 + \frac{q^2}{m_{\rho}^2}}{\left(1 + \frac{4q^2}{m_{\rho}^2}x(1-x)\right)^{3/2}}$$

- In the limit $q^2 \rightarrow -m_{\rho}^2$ it becomes $\delta\left(x \frac{1}{2}\right)$
- $\phi_{\perp\parallel}(x,q^2=0)=1$ in local models

Definitions Results QCD evolution Pion-photon TDA

Photon's LCWF

The light-cone wave function (k_{\perp} -unintegrated) has a simple form in SQM (at the QM scale):

$$\Phi_{\perp\gamma}(x, \boldsymbol{k}_{\perp}) = \frac{6}{m_{\rho}^2 (1 + 4\boldsymbol{k}_{\perp}^2/m_{\rho}^2)^{5/2}}$$

Note the power-law fall-off at large transverse momenta, $\Phi_{\perp\gamma}(x, \mathbf{k}_{\perp}) \sim 1/k_{\perp}^5$. In cross section this leads to tails $\sim 1/k_{\perp}^{10}$. For the virtual photon

$$\Phi_{\perp\gamma^*}(x, \mathbf{k}_{\perp}) = \frac{6\left(1 + \frac{q^2}{m_{\rho}^2}\right)}{m_{\rho}^2 \left(1 + 4\frac{\mathbf{k}_{\perp}^2 + q^2 x(1-x)}{m_{\rho}^2}\right)^{5/2}}$$

Definitions Results **QCD evolution** Pion-photon TDA

LO ERBL of the tensor DA of the virtual photon

Initial conditions (dots) from SQM. Solid lines: evolution to scales 1, 2.4, 10, and 1000 GeV, asymptotic form 6x(1-x): dashed line $(3, 3, 4, 5) \in (3, 3, 5)$

WB Photon from chiral models

Definitions Results QCD evolution **Pion-photon TDA**

Pion-photon Transition Distribution Amplitudes

[Pire+Szymanowski 05] – as GPD, but between the π and γ states

Top: vector TDA at $q^2 = 0$ (left) and $q^2 = 0.4 \text{ GeV}^2$ (right) several values of ζ : -1, -2/3, -1/3, 0, 1/3, 2/3, and 1. Bottom: same for the axial TDA (SQM at the QM scale)

- Chiral quark models provide a link between high- and low-energy analyses. They yield in a fully dynamical way the initial conditions for the QCD evolution, which is essential to bring the predictions to experimental/lattice scales
- Numerous predictions for soft matrix element involving the Goldstone bosons and photons
- Scale in chiral quark models is very low, 320-500 MeV, QCD evolution "fast"
- Simple analytic formulas useful to understand general properties, (e.g., no factorization of the t-dependence
- For the pion, with the LO QCD evolution the overall agreement with the available data and lattice simulations is very reasonable (PDF, DA, generalized form factors, GPD, TDA, ...)
- **(a)** [Pire+Szymanowski 09] $l\bar{l}$ photoproduction $\rightarrow \phi_{\perp\gamma} \left(\frac{\alpha Q^2}{q^2+Q_\perp^2}\right) h_1^q(1)$
- Predictions can be further tested with future lattice simulations also for the photon/ ρ
