Luminosity measurement with the CMD-3 detector at the VEPP-2000 e+e- collider.

Tuesday 23 August 2016 11:20 (20 minutes)

Since December 2010 the CMD-3 detector has taken data at the electron-positron collider VEPP-2000. The collected data sample corresponds to an integrated luminosity of 60 1/pb in the c.m. energy range from 0.32 up to 2 GeV. Preise luminosity measurement is a key issue for many experiments whih study the hadronic cross sections at e+e– colliders. The integrated luminosity of the collider was measured using two well known QED processes e+e–⟶e+e–, γγ. The preliminary results of the luminosity measurement are presented in the various energy range. The current accuracy of the luminosity determination is estimated to be 1%. The study of the different systematics is in progress now and in forthcoming future we hope to reduce it to the level of ~0.5%. These methods will be usefull for luminosity measurement at future e+e- super c-tau factory in Novosibirsk.
