

Status of Undulator Systems January 2009

Joachim Pflüger XFEL / DESY

R& D Activities

- Pre-Series Prototype Mechanics
- Phase Shifter
- Magnetic Measurements, XFEL Measurement Room
- Tunnel Temperature Stabilization
- In Kind Contributions to WP71
- Time Schedule

R & D Actitivities

XFEL 5m Pre-Series Prototype Design

Reviewed Design 2008 for Pre-Series Prototypes

Motto simpler, better, cheaper

Includes:

- Relaxed Tolerances: Girder Material AIMg Y. Li, B. Faatz, J. Pflueger, Phys. Rev. ST-AB 1,100701 (2008)
- Simplified Girder Guiding → cheaper AND better
- Low Friction spherical Support Unit of Girder
- Smaller and cheaper Spindles
- Direct Measurement of Gap

European

Old: Girder Guiding using separate Guide Rail

Strict separation between:

- Load support (Load ↔ deformation)
- Force free girder guiding (precision)

New: Girder guiding by Support

Problem: The old intermediate girder deforms und magnetic forces. Girders deflect by 500µrad each

Solution:

- Girders have a rotational degree of freedom of low friction
- Alignment through the support guide way, adjustable via screws
- Girder Tilt $\approx \le \pm 100 \ \mu rad \rightarrow more \ accurate \ and \ cheaper$

XFEL Direct Measurement of Gap

Required Accuracy $\pm 1\mu m$ Problem: Forces of Measurement Best Result at present: $\pm 1\mu m$

Prototyping Experience (Dec 08)

Phase Shifter

XFEL User's Meeting, Jan 28, 2009 J. Pflüger, XFEL

XFEL Phase Shifter: General

XFEL User's Meeting, Jan 28, 2009 J. Pflüger, XFEL

XFEL Phase Shifter: Final Results

Huihua Lu, Jian Zhuang, Motuo Wang, IHEP

J. Pflüger

New Magnetic Lab, Magnetic Measurements

XFEL Magnetic Measurements, New Magnetic Lab

Progress in 2008

- Magnetic Measurements
 - Pole Height and Tilt Tuning is working fine, routinely used
 - Magnet Measurement Techniques needed for XFEL is available
- New Magnetic Lab
 - Lab operational
 - Temperature Specs fulfilled
 - Control Software working
 - In Use for PETRA III Devices

Pole Height Adjustment using µm Dial Gauges

Double Bridge in Use

Measurement Bridge

Pole Height Measurement Attachment of Measurement Bridge

Reading Accuracy: ±1µm Requirement:

±5µm

Direct view Simple, easy to use preferred Method

XFEL Field Measurements Results New Lab

FEL XFEL Magnetic Lab with 0.1°C Stability

(C. Schulz)

Local Temperature Stability

Tunnel Temperature Stabilization

XFEL Tunnel Temperature Stabilization

- Reduced Tolerances on Air Conditioning
 Y. Li, B. Faatz, J. Pflueger, Phys. Rev. ST-AB 1,100701 (2008)
 - Requirement of ± 0.1°C Variation over whole Systems is relaxed to ± 0.1-0.2°C over ONE undulator Cell
 - Temperature Deviation is compensated with Gap Adjustment
- Old concept was very expensive
- Study of alternative Concepts, using longitudinal Air Flow (C. Schulz)
- Heat Transport properties in the Tunnels are important:
 - Marl, Glacial Till no water convection: Good Insulator
 - Sand and Gravel with Water Convection: Poor Insulator
- Measurements in the HERA to get Information

XFEL Objectives of HERA Measurements

- HERA Tunnel as an example of the XFEL tunnels
 - Temperature ≈20°C, Tunnel is still maintained (Heated)
 - Ground Water: Ost-Rechts Sand: Süd-Rechts
- Thermal Situation the HERA Tunnel
 - Equilibrium Soil Temperatures 5m around Tunnel with / without Ground Water
 - Thermal Response to Changes in Heat Load shut off
- Impact on Design of XFEL Air Conditioning System
 - Cooling and/or Heating required? How much?
 - Dehumidifiers needed?
 - Design of Air Conditioning System
 - Impact on Cost

Temperature Stability

Li, Faatz, Pflueger

- ρ requires temperature stability < 0.1°C
- Constant Gradient, i.e. K changes linearly over system length

EL First HERA Results (C. Schulz & Uni Stuttgart)

Soil Temperature 0-3.5m Outside the HERA Tunnel Start 2.12.08 Tunnel Temperature: 22-23°C

Radial Distance [m]

- $Q = \frac{\lambda}{d} A \Delta T$
- **Q** : Heat Flux
- λ: Heat Conductivity 2.3 W/mK for Concrete
- d: Thickness of Concrete 0.3m
- A: Area = $16.7 \text{ m}^2 \text{ per m Tunnel}$
- ΔT : Temperature Difference

	ΔT [K]	Q [W/m]						
Süd-Rechts	0.5	64						
Ost Rechts	3.0	380						

XFEL Time Line of HERA Measurements

- Measurements until End of Feb 09
- Data Evaluation until End of April
- Definition of the Air Conditioning Concept until Nov 09
- Detailed Design Aug 2011

In Kind Contributions

XFEL CIEMAT Madrid

Design and Production of Components for 92 Intersections: Phase Shifters, Quadrupole Movers, Support Bases

Option:

System Resonsibility for Complete Intersection Sub-Assemblies

Status: Approved by Spanish Side Waiting for XFEL GmbH

XFEL CELLS Barcelona

Production Management of the SASE3 Standard Undulator Segments

Production of 21 XFEL Standard Mechanics and SASE3 Magnet Structures:

Tendering, Project Management, Quality Management.....

 Magnetic Tests and Tuning @XFEL, Commissioning

Status: Approved by Spanish Side Waiting for XFEL GmbH

XFEL Standard Segment

XFEL Manne Siegbahn Lab, Stockholm

Development and Implementation of a Precision Method to measure Qudrupole Properties in the Undulator Intersections

Approved by Swedish Side Waiting for XFEL GmbH

Test Setup with FLASH TQG July 08
