

# Unpolarized and helicity distributions from global fits

Alberto Accardi

Hampton U. and Jefferson Lab

QCD-N'16

Getxo (Spain) – July 11<sup>th</sup>, 2016

# Overview

## □ A PDF landscape

## □ Proton and neutron PDFs: the CJ15 fit

- Hadronic physics I : d/u ratio
- Hadronic Physics II :  $d\bar{u}$  /  $u\bar{u}$  ratio
- Nuclear Physics output: off-shell parton corrections
- High-energy: BSM searches

## □ Iterative Monte Carlo – the JAM approach

- “JAM15” helicity PDFs
- A strange puzzle
- “JAM-FF16” fragmentation functions

### REFERENCES:

## □ High-energy (*large to small x*) → J.Rojo's talk

- Beyond the Standard Model searches
- NuTeV weak mixing angle
- Precision (Higgs) physics
- Small-x and gluonic “matter”

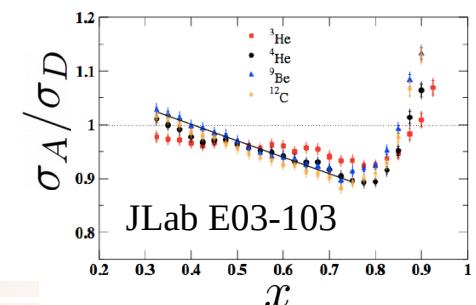

## □ Hadron structure (*large to medium x*) → THIS talk

- Effects of confinement on valence quarks
- $q - \bar{q}$  asymmetries; isospin asymmetry
- Strangeness, intrinsic charm
- Spin, parton orbital motion, color dynamics

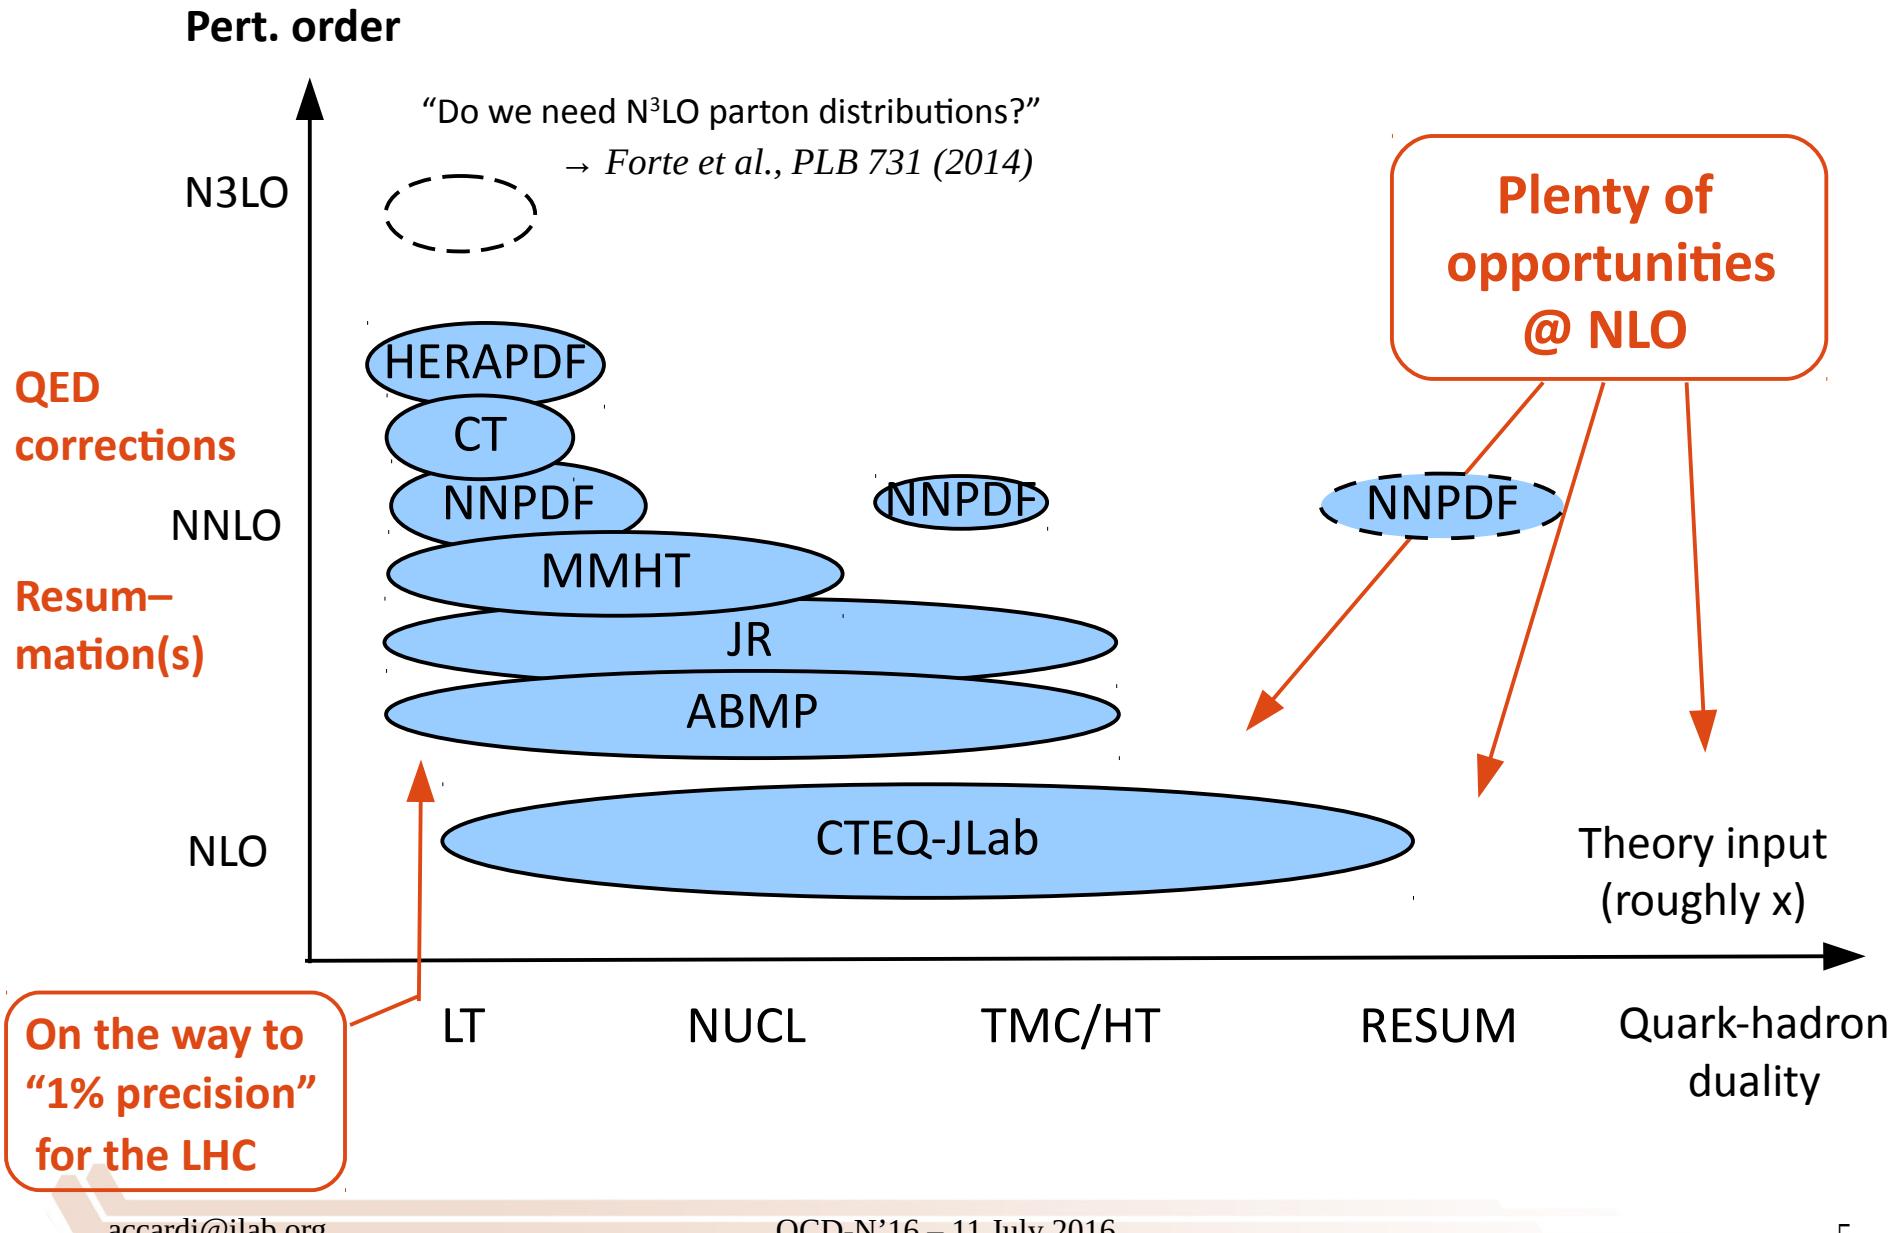

## □ Nuclear Physics → Mostly in backup

- Bound nucleons, EMC effect, SRC
- p+A and A+A collisions at RHIC / LHC
- Color propagation in nuclear matter

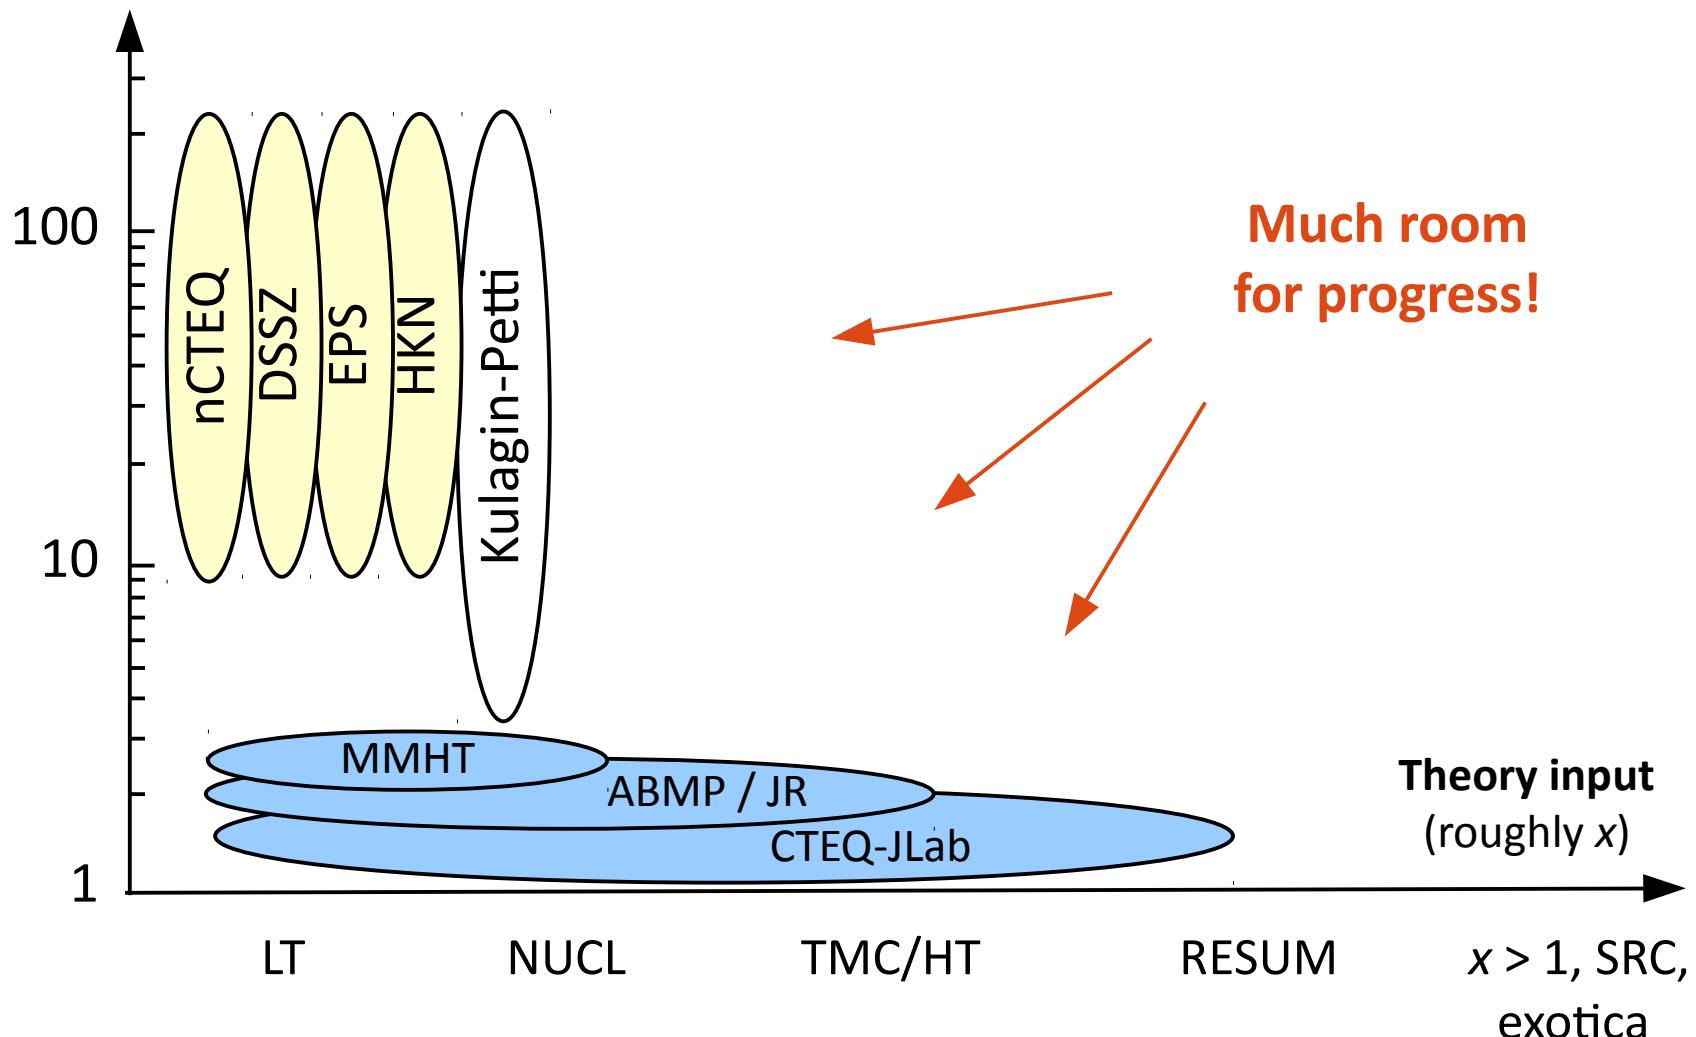

# A PDF landscape

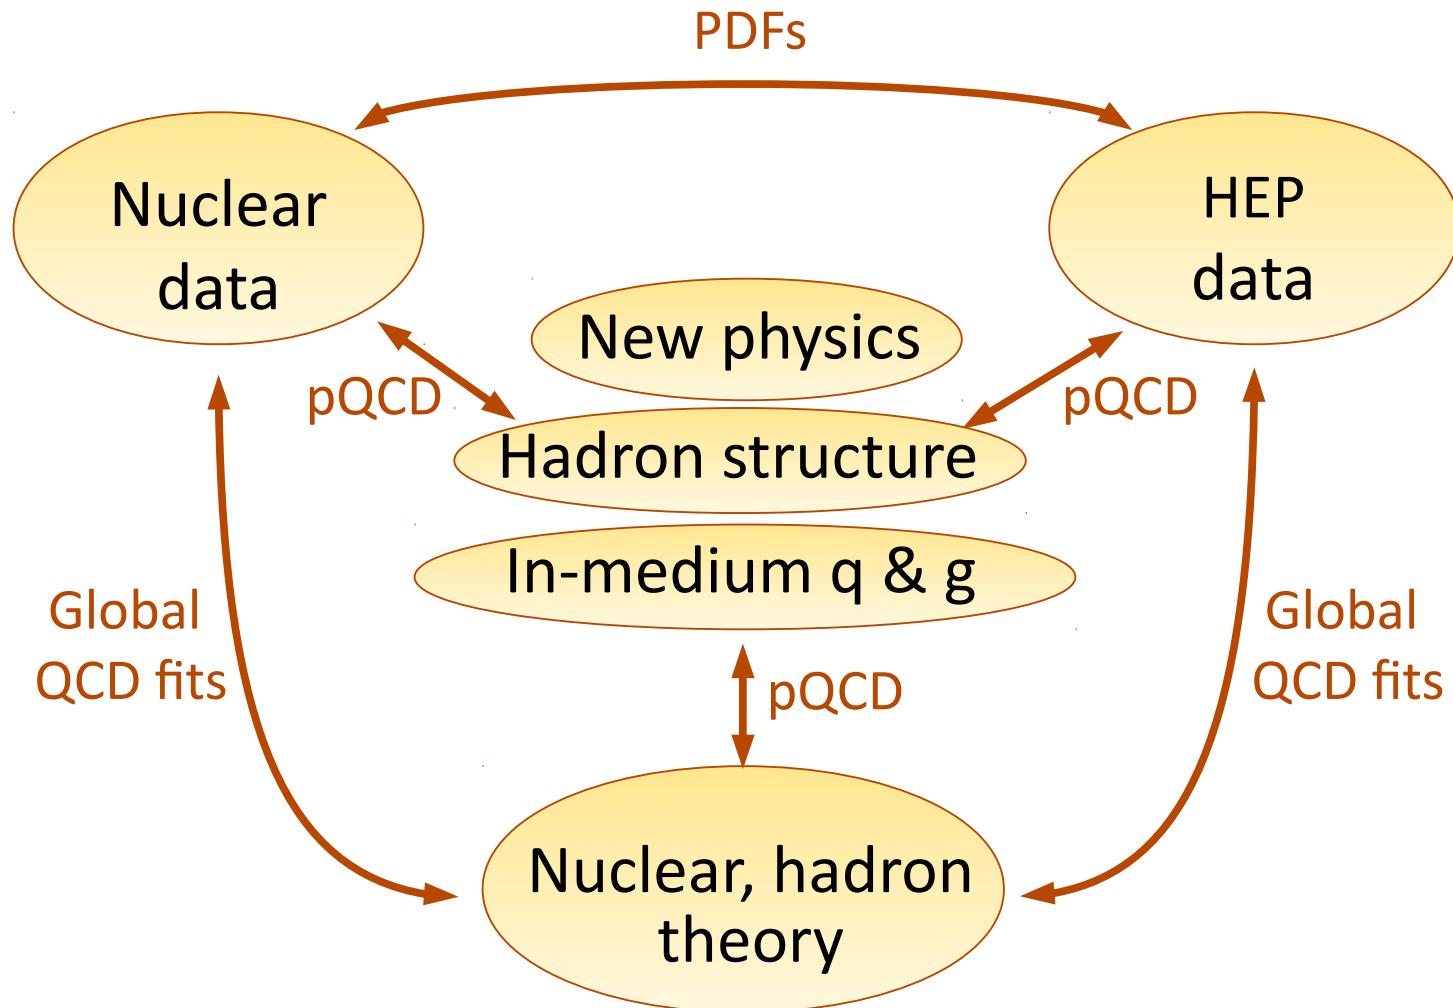

# A nPDF landscape

Atomic number

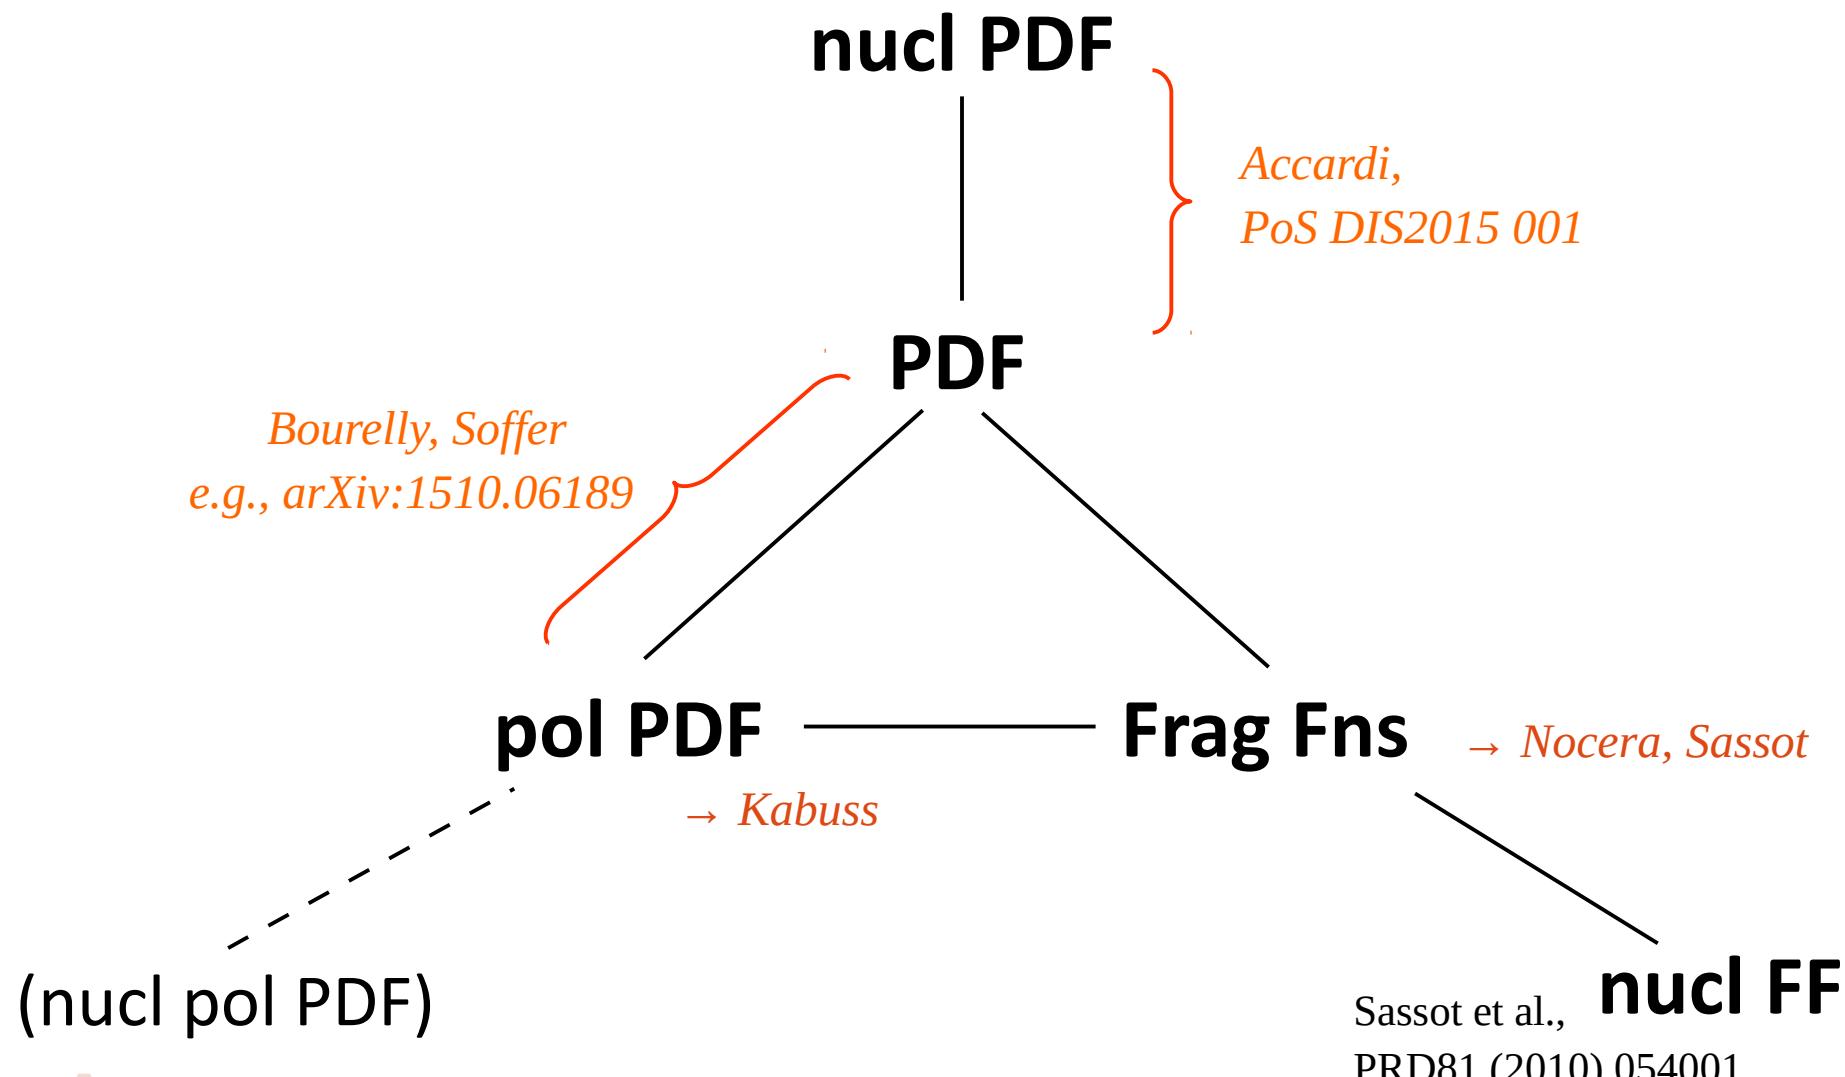

# Needs the betrothal of HEP and NUCL

- A global approach across subfields

# Other possible marriages

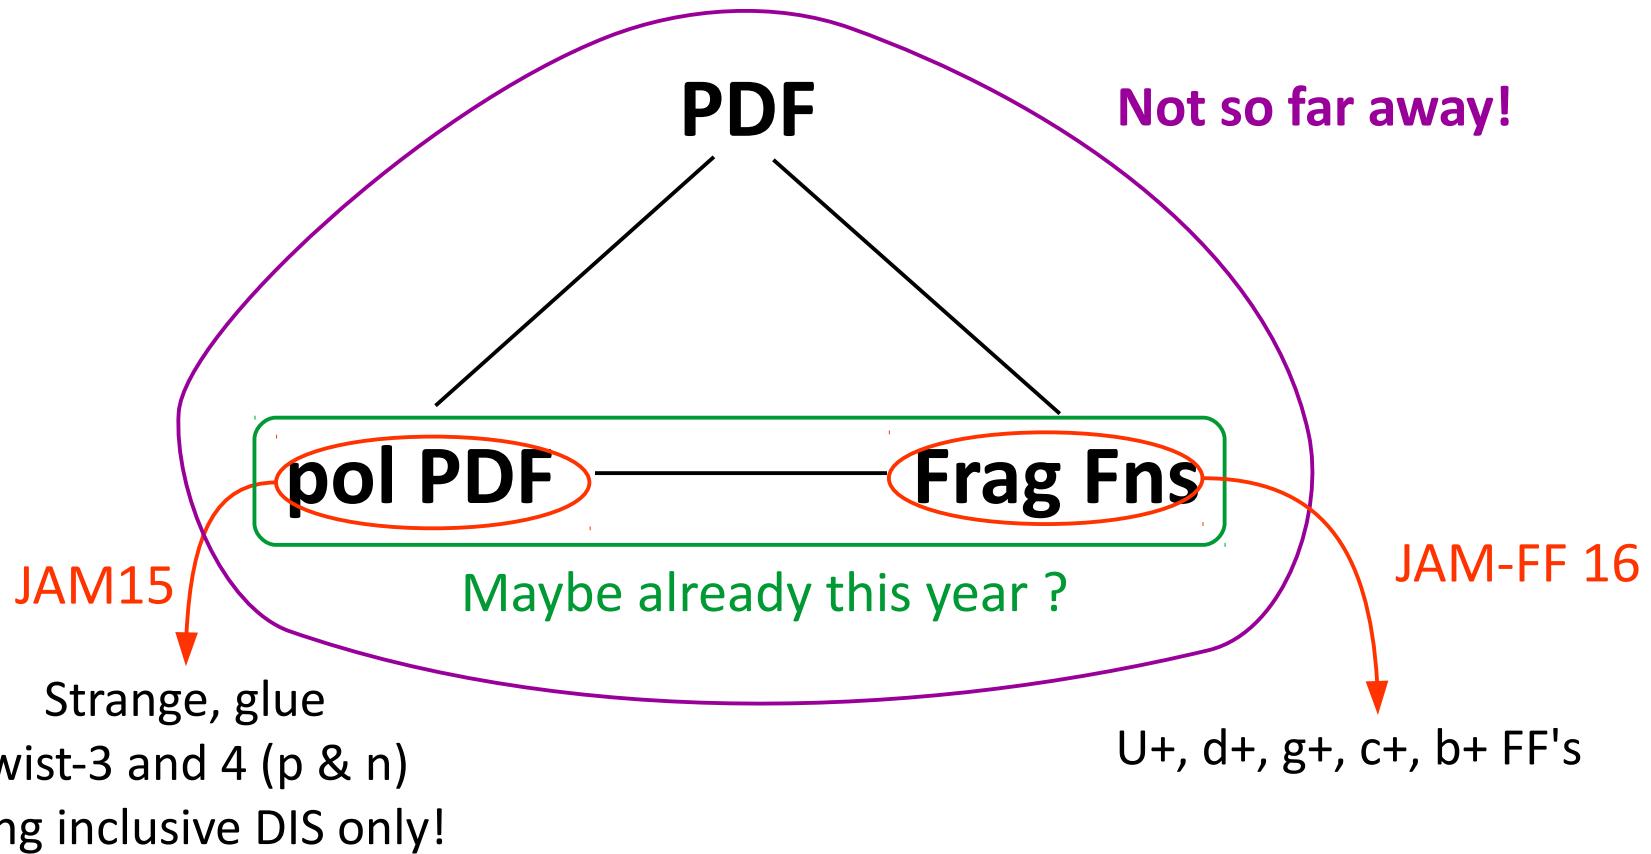

# New fitting methods

- More computing power, efficient implementations
  - New fitting, analysis methods
- Traditional fits:
  - Detailed  $\chi^2$  scans, refined statistical analysis
- Monte carlo fitting methods:
  - **NNPDF**: bootstrap + neural network fit
  - **JAM**: bootstrap + Iterative Monte Carlo (IMC) approach
    - *Sato, Ethier, Kuhn, Melnitchouk, Accardi (2015)*
- Large number of parameters, trustable uncertainty estimates
- Self organizing maps → *Liuti et al.*

# Iterative Monte Carlo approach

- Provides control over large number of parameters
- Maximizes extraction of physics information from data

# Proton and neutron PDFs - the CJ15 global fit -

*Accardi, Brady, Melnitchouk, Owens, Sato*  
*PRD93 (2016) 114017*

# The CTEQ-JLab global fits

## ❑ Collaborators:

- **Theory:** A.Accardi, W.Melnitchouk, J.Owens, N.Sato
- **Experiment:** E.Christy, C.Keppel, P.Monaghan

## ❑ All-x PDF global fits, focused on the “large” $x$ region

- Maximize use of large- $x$  data (esp. DIS)
- Include all relevant large- $x$  / small- $Q^2$  theory corrections
- ***Quantitatively evaluate theoretical systematic errors***
- ***Use PDFs as tools for nuclear and particle physics***

## ❑ Latest public release: CJ15

- [www.jlab.org/cj](http://www.jlab.org/cj)
- Included in LHAPDF

# New in CJ15

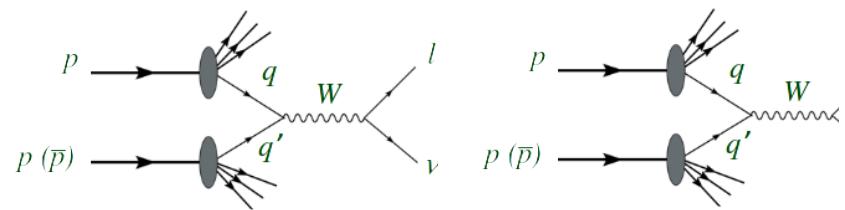

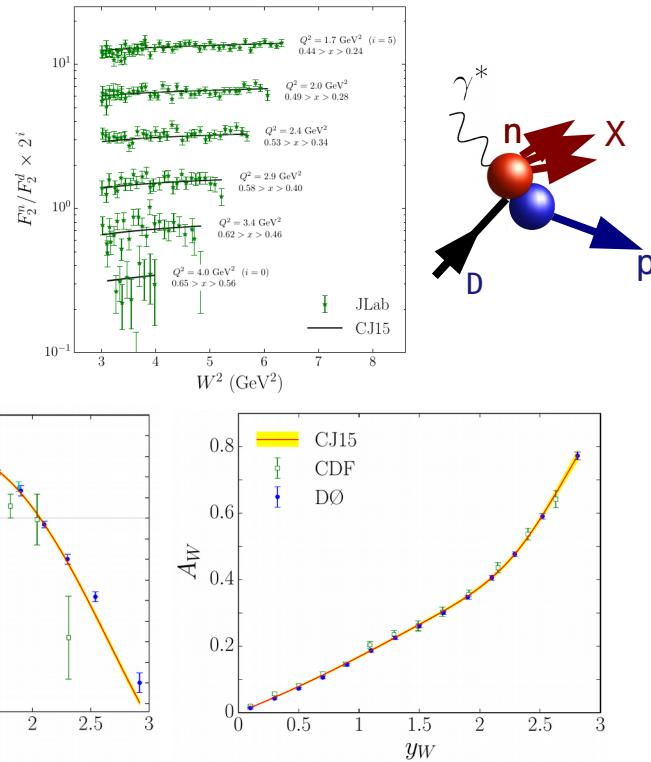

## ❑ s-ACOT scheme for heavy flavors

## ❑ New data:

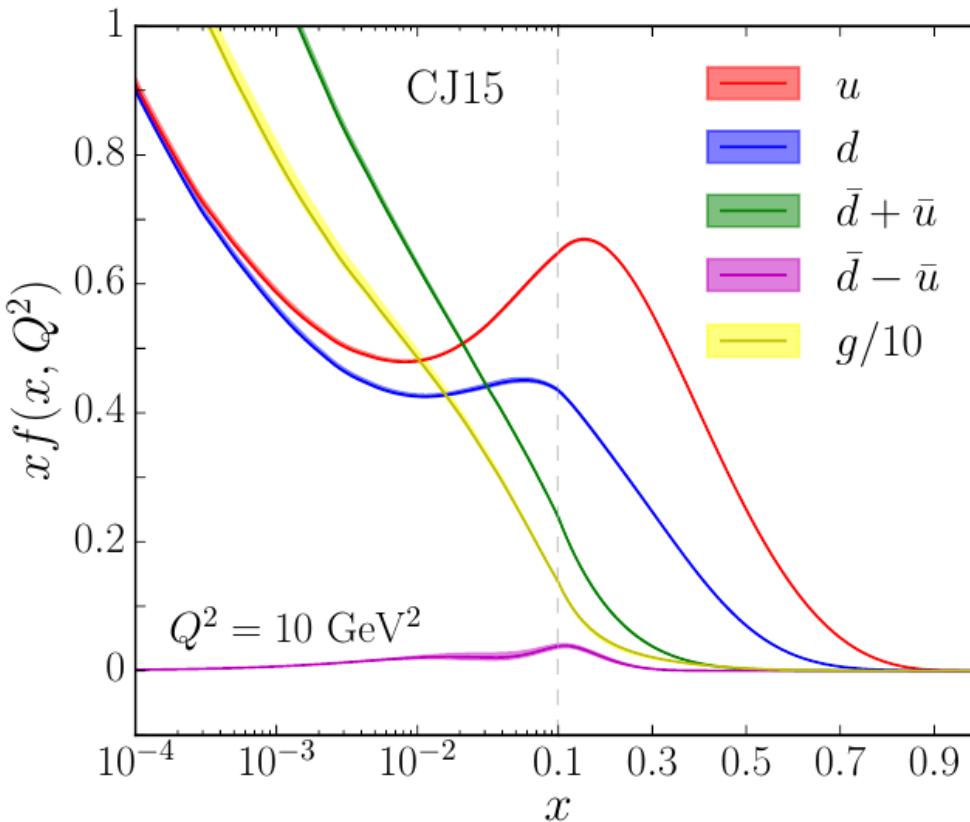

- BONUS spectator tagged DIS
- HERA I+II combination
- HERMES F2
- High-statistics W-boson charge asymmetries from D0

## ❑ New off-shell nucleon treatment in deuteron targets (DIS and DY)

- Parametrized vs. modeled → absorbs wave function uncertainty
- Comparison to extractions from deuteron and DIS on heavier targets

# CJ15 - PDFs

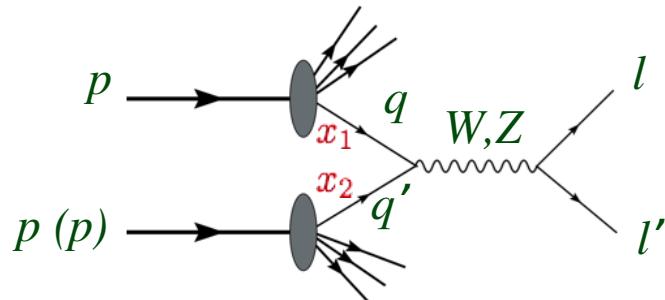

- ❑ NLO fit gives  $\chi^2/\text{datum} = 1.04$
- ❑ LO fit much worse – cannot accommodate  $Q^2$  dependence of data

- ❑ Hessian error analysis
  - Correlated errors where available
- ❑ Error bands displayed for  
 $\Delta\chi^2 = 2.71$   
( 90% confidence level  
in a perfect, Gaussian world )

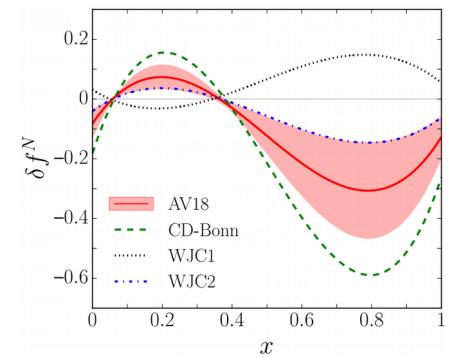

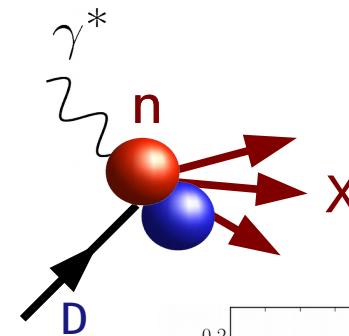

# NUCL / HEP symbiosis

- $W$  and  $Z \rightarrow$  constrain  $d$ -quark at largest  $x$  on proton targets

$$A_W(y) \approx \frac{d/u(x_2) - d/u(x_1)}{d/u(x_2) + d/u(x_1)}$$

- Compare to deuteron DIS
  - constrain deuteron corrections
  - **Off shell correction – first time in Deuteron!**

# NUCL / HEP symbiosis

- Ignoring nuclear dynamics, SLAC(d) and DØ(W) pull  $d$  quark in opposite directions
- **DØ (W) data determine nuclear corrections !!**
  - other asymmetries inconclusive by themselves
  - **BONUS data validate DØ(W) analysis**

# Hadronic physics output 1: d/u ratio

- **d-quark determined by  $p+p \rightarrow W+X$**
- **Nuclear corrections dominant at large  $x$** 
  - SLAC(d)'s statistical power used to fit the off-shell function...
  - ... and to improve d/u flavor separation, esp. at  $x < 0.3$  (see backup)

# Hadronic physics output 1: d/u ratio

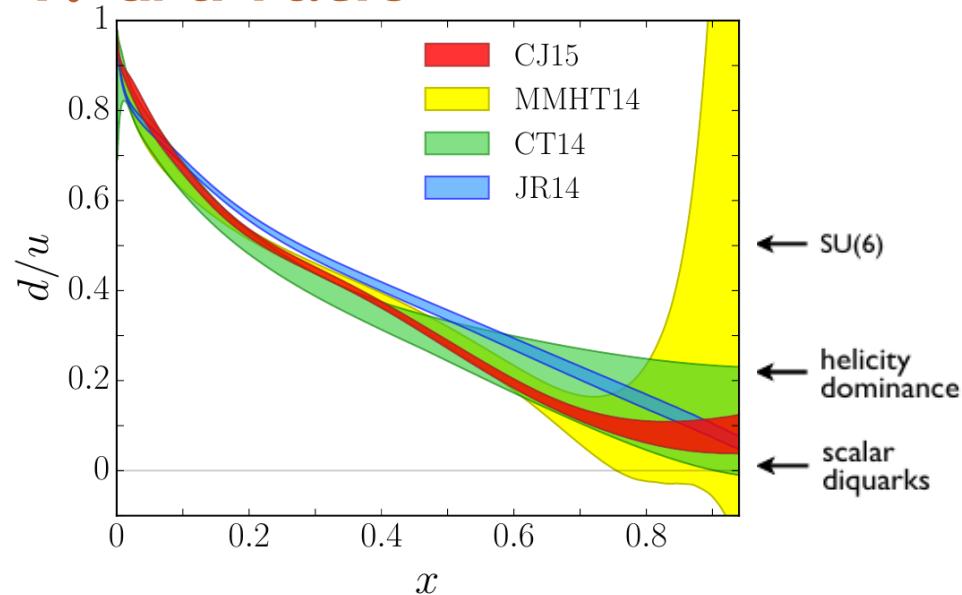

→ *d/u ratio at high  $x$  of interest for nonperturbative models of nucleon*

→ CJ15:  
more flexible parametrization

$$d \rightarrow d + b x^c u$$

allows finite, nonzero  $x = 1$  limit

(standard PDF form gives 0 or  $\infty$  unless  $a_2^d = a_2^u$ )

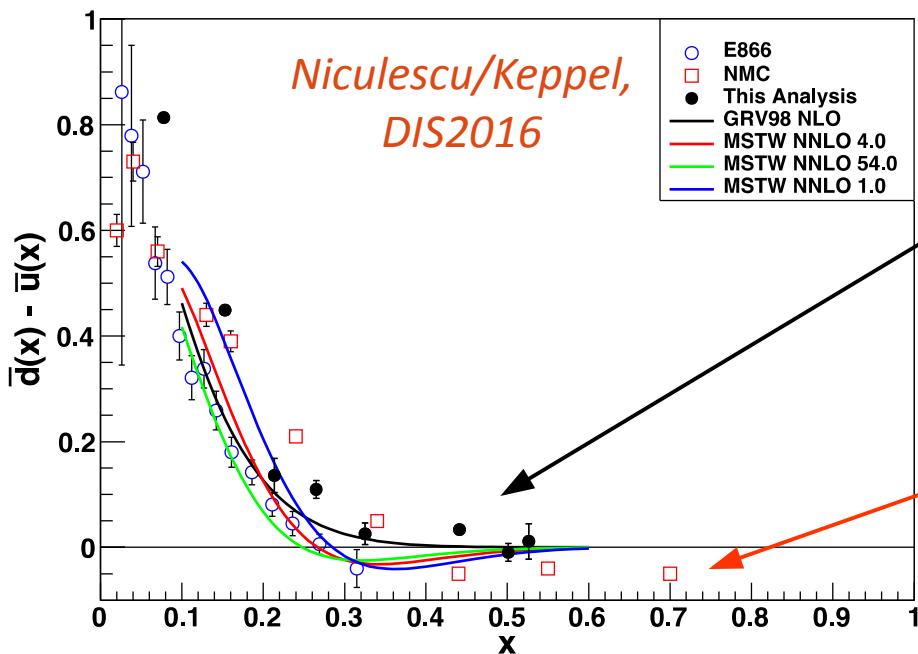

MMHT14: fitted deuteron corrections  
standard  $d$  parametrization  
→ “UNDERCONSTRAINED”

JR14 (and ABM12):  
Similar deuteron corrections  
standard  $d$  ; no lepton/W asym.  
→ “OVERCONSTRAINED”

CT14:  $\beta_u = \beta_d \implies d/u$  finite  
No nuclear corrections

# Hadronic physics output 2: dbar/ubar

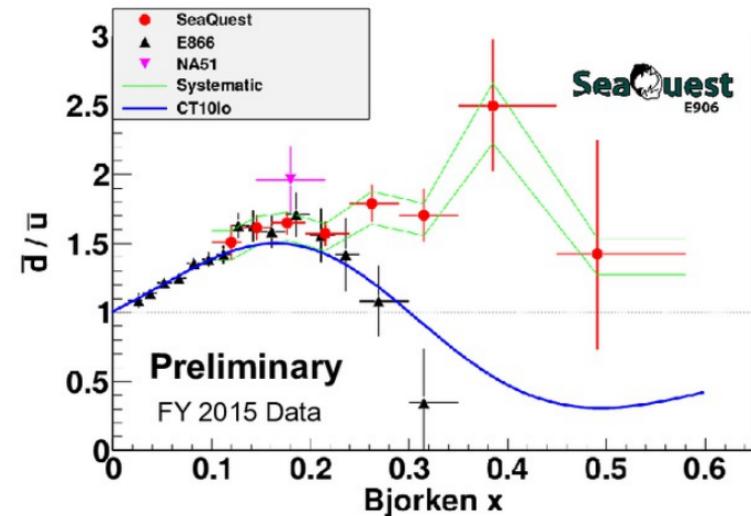

[AA, Keppel, Niculescu, DIS 2016]

This analysis: use CJ15 to “remove” nuclear corrections

NMC = Peng et al. analysis of NMC data as in publication (use MSTW08 for uv, dv)

- ❑ No evidence for sign change at large  $x$  !
- ❑ And SeaQuest agrees!
  - presented for the first time a few days later

# Iterative Monte Carlo: the JAM approach

*Sato, Ethier, Melnitchouk, Kuhn, Accardi*

*PRD 2016 [arXiv:1601.07782] & work in progress*

# Fitting strategy

## Parametrization

- $xf(x) = Nx^a(1-x)^b(1+c\sqrt{x}+dx)$
- LT quark distributions  $\rightarrow \Delta u^+, \Delta d^+, \Delta s^+, \Delta g$
- T3 quark distributions  $\rightarrow D_u, D_d$
- T4 structure functions  $\rightarrow H_p, H_n$

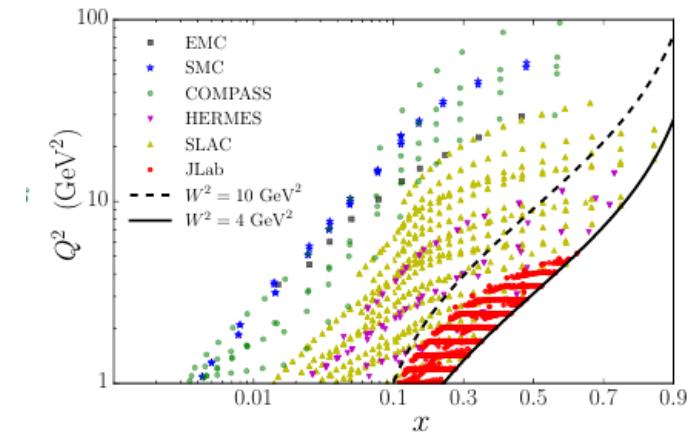

**Chi-squared minimization**  $\rightarrow$  with correlated systematic uncertainties

$$\chi^2 = \sum_i \left( \frac{D_i - T_i(1 - \sum_k r^k \beta_i^k / D_i)^{-1}}{\alpha_i} \right)^2 + \sum_k (r^k)^2$$

## Issues

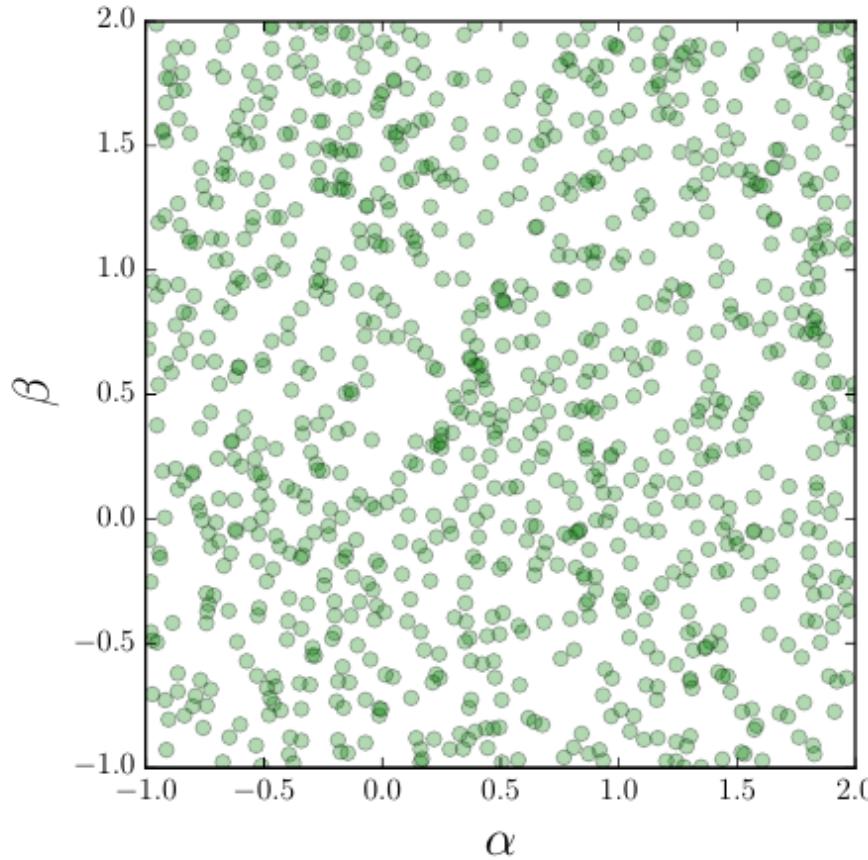

- Stability in the moments (e.g.  $\Delta \Sigma^{(1)}$ )
- Is the solution given by a single fit unique?  $\rightarrow$  False minima
- Is over-fitting present in our fits?
- Which parameters should be fixed and at which value?
- Determination of uncertainty bands.

**Solution**  $\rightarrow$  MC approach; iterate until convergence  $\rightarrow$  **data driven uncertainties**

# Iterative Monte Carlo (IMC) analysis

Toy example → fitting 2 model parameters  $\alpha, \beta$

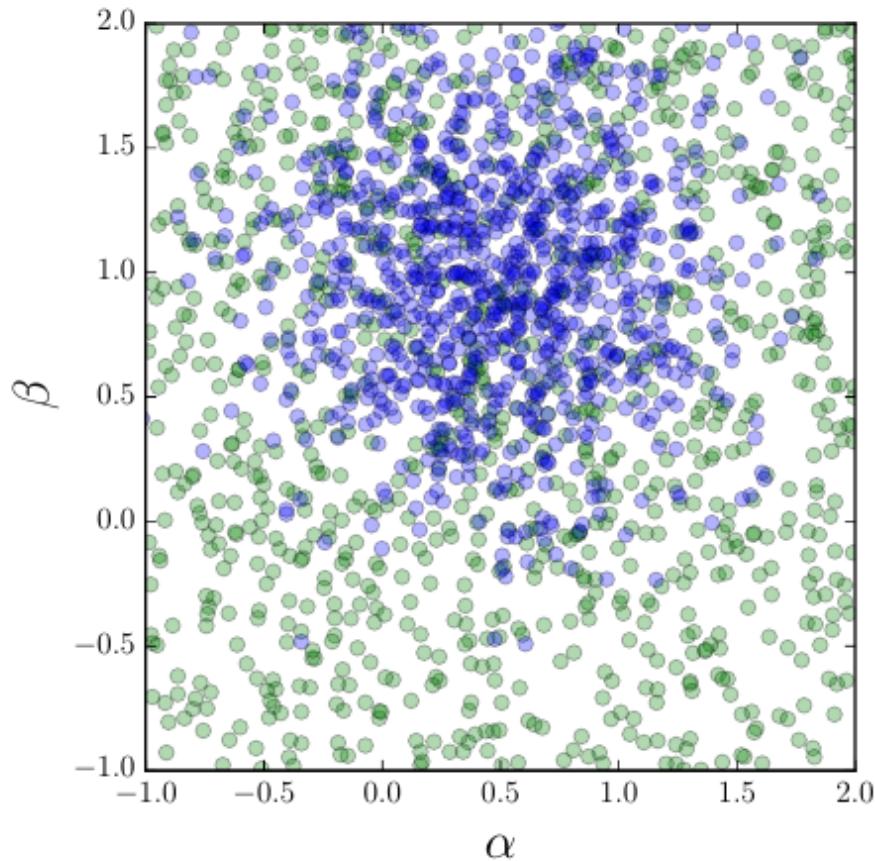

## I. Flat sampling

Initial priors  $\{(\alpha, \beta)\}$

# Iterative Monte Carlo (IMC) analysis

Toy example → fitting 2 model parameters  $\alpha, \beta$

## I. Flat sampling

Initial priors  $\{(\alpha, \beta)\}$

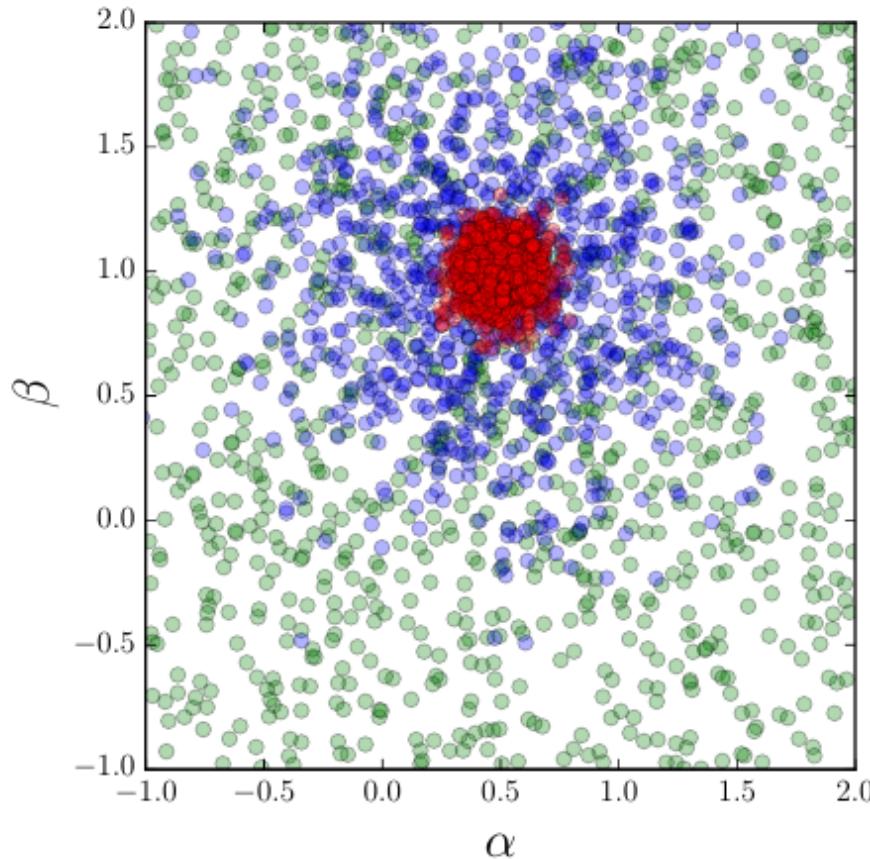

## II. First iteration

priors  $\{(\alpha, \beta)\}$

posteriors  $\{(\alpha, \beta)\}$

# Iterative Monte Carlo (IMC) analysis

Toy example → fitting 2 model parameters  $\alpha, \beta$

## I. Flat sampling

Initial priors  $\{(\alpha, \beta)\}$

## II. First iteration

priors  $\{(\alpha, \beta)\}$

posteriors  $\{(\alpha, \beta)\}$

## III. Second iteration

priors  $\{(\alpha, \beta)\}$

posteriors  $\{(\alpha, \beta)\}$

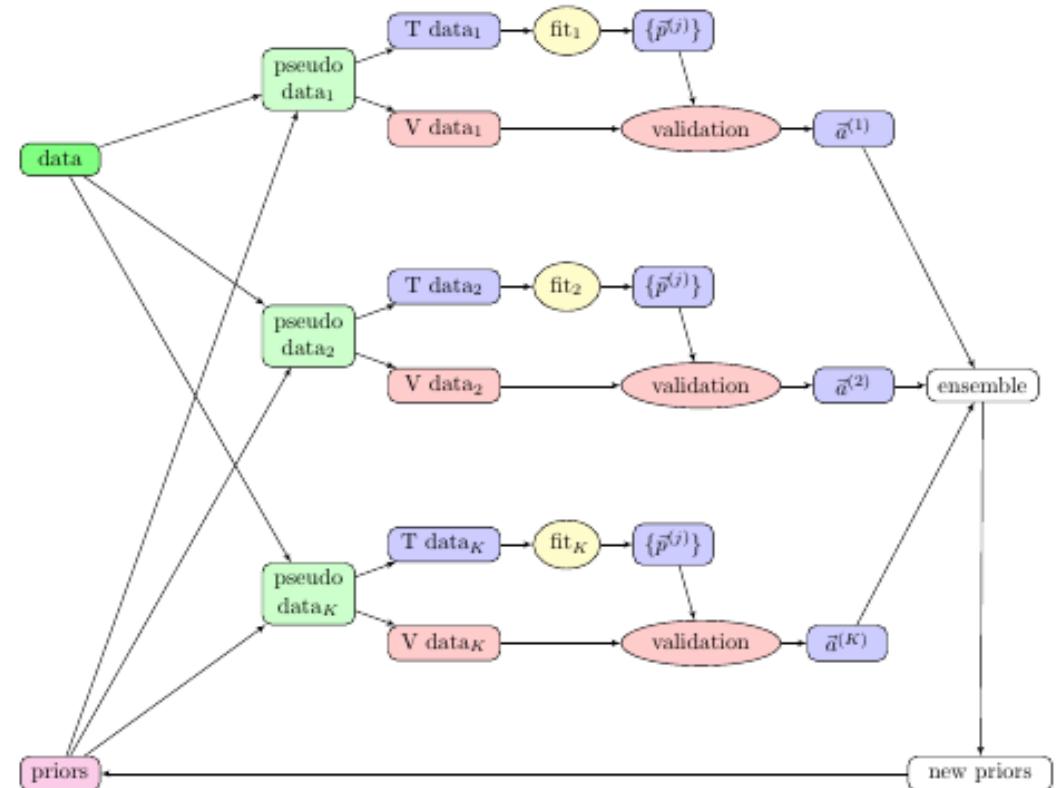

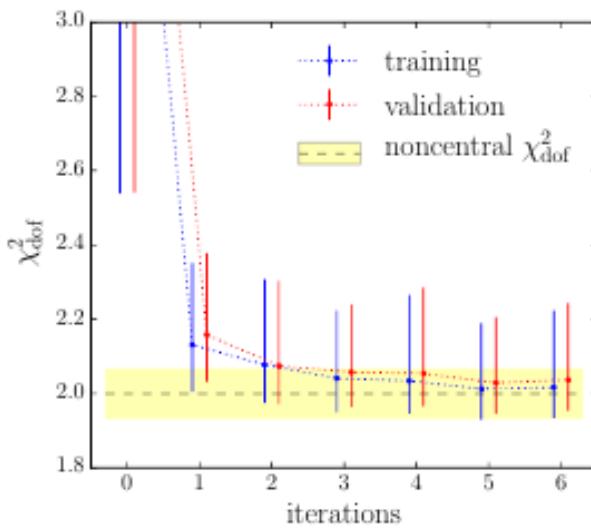

... until convergence

# Iterative Monte Carlo (IMC) analysis

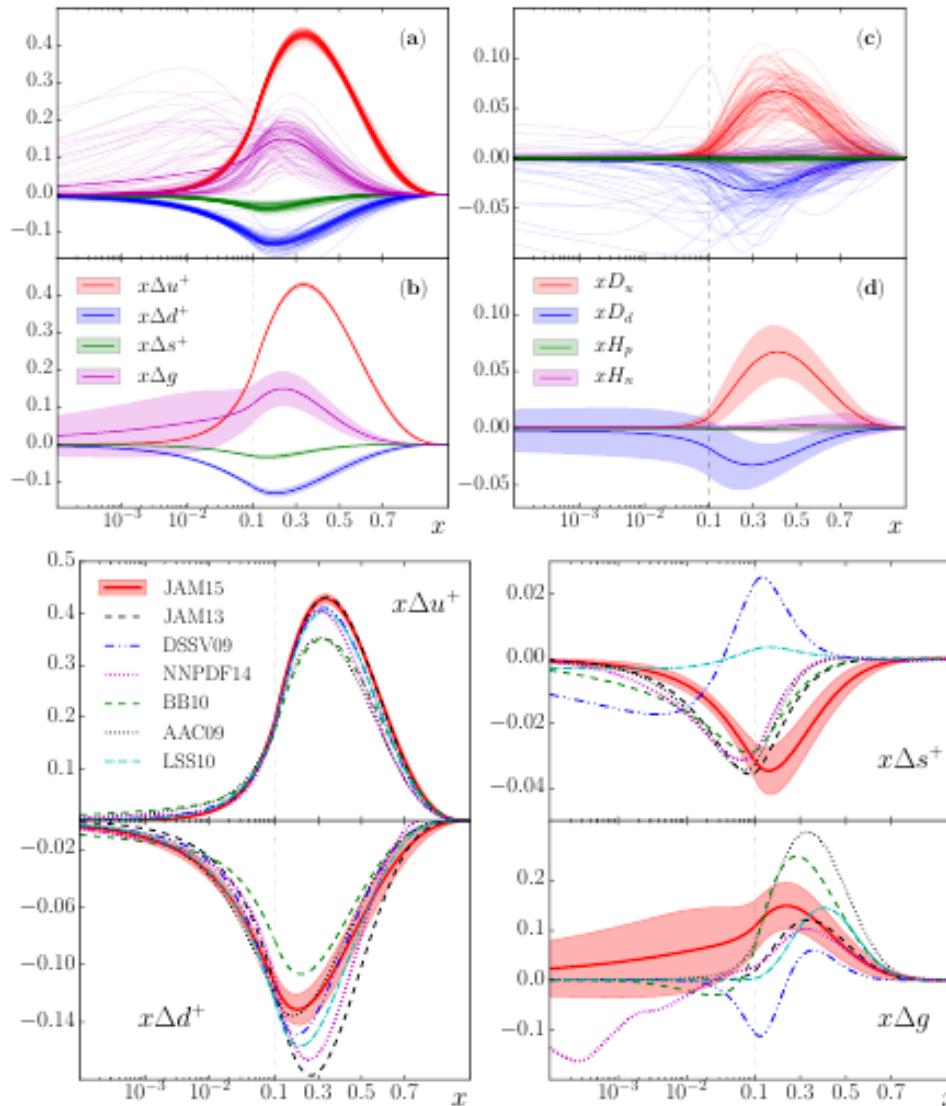

## Each iteration

- Generate pseudo data sets via data resampling
- Random data partition → Training & Validation
- Fit the training set
- Validation

# of fits: 10000

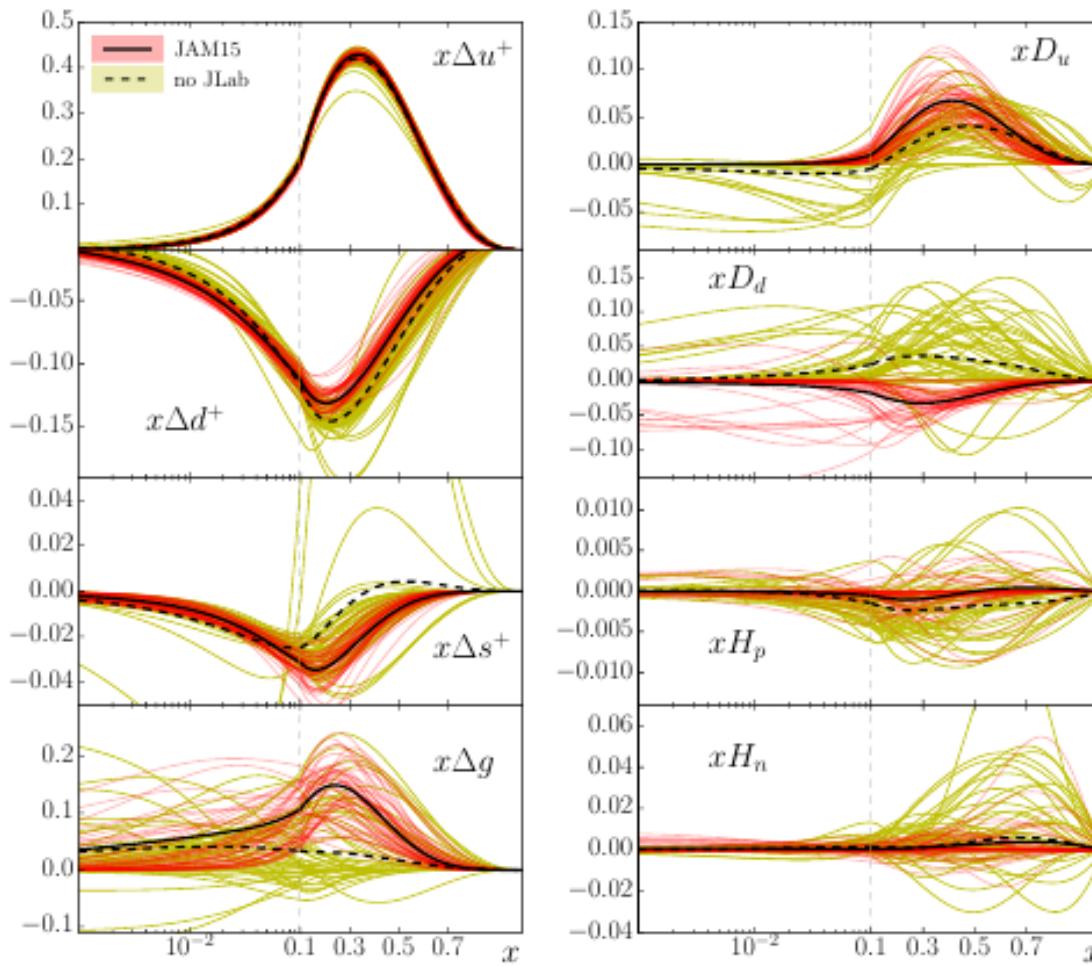

# The JAM15 polarized PDFs

| moment          | truncated          | full               |
|-----------------|--------------------|--------------------|
| $\Delta u^+$    | $0.82 \pm 0.01$    | $0.83 \pm 0.01$    |
| $\Delta d^+$    | $-0.42 \pm 0.01$   | $-0.44 \pm 0.01$   |
| $\Delta s^+$    | $-0.10 \pm 0.01$   | $-0.10 \pm 0.01$   |
| $\Delta \Sigma$ | $0.31 \pm 0.03$    | $0.28 \pm 0.04$    |
| $\Delta G$      | $0.5 \pm 0.4$      | $1 \pm 15$         |
| $d_2^p$         | $0.005 \pm 0.002$  | $0.005 \pm 0.002$  |
| $d_2^n$         | $-0.001 \pm 0.001$ | $-0.001 \pm 0.001$ |
| $h_p$           | $-0.000 \pm 0.001$ | $0.000 \pm 0.001$  |
| $h_n$           | $0.001 \pm 0.002$  | $0.001 \pm 0.003$  |

- Significant constraints on  $\Delta s^+$  and  $\Delta g$
- Non zero T3 quark distributions
- T4 contribution to  $g_1$  consistent with zero
- **Negative  $\Delta s^+$**
- JAM15  $\Delta g$  compatible with recent DSSV fits.

# Impact of JLab data

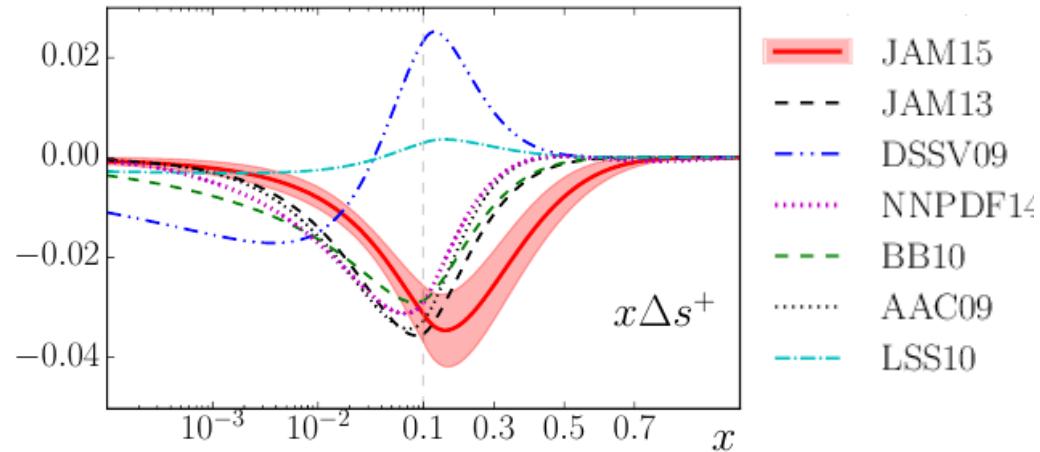

- JLab data  $\rightarrow 0.1 < x < 0.7$
- Constraints on small  $x$  from large  $x \rightarrow$  weak baryon decay constraints
- Large uncertainties in  $\Delta s^+$ ,  $\Delta g$  removed by JLab data
- Non vanishing T3 quark distributions
- T4 distributions consistent with zero

# A strange puzzle

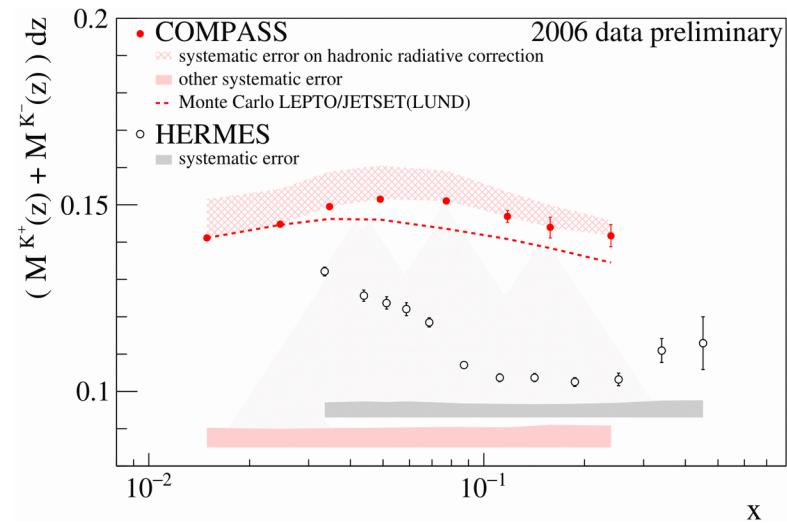

## □ $\Delta s$ : positive or negative?

- Depends on kaon FF used in SIDIS calculations!

## □ $s$ : large or small?

- Difference in size reconciled by removing hadron mass corrections  
→ see backup
- Extraction of  $s(x)$  strongly affected on kaon FF systematic uncertainty

# The JAM FF 2016 fit

- Kaon FF too uncertain, correlated to strange PDF in SIDIS

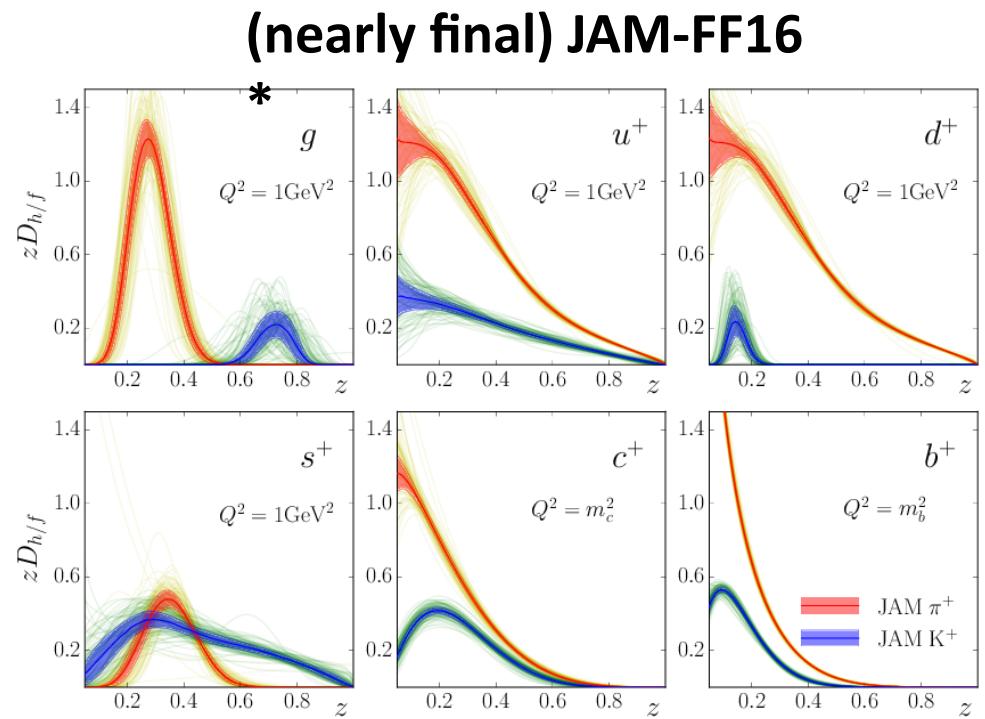

- Cannot take kaon FF off the shelf
- Need in-house extraction

- Iterative MC approach

- Only SIA data used :  
npts=245,  $\chi^2 = 305.2$

- Strange-to-kaon FF:

- Between HKNS and DSS
- Expect combined DIS/SIDIS analysis to give negative  $\Delta s$   
(But wait and see!)

\* not the official name, yet

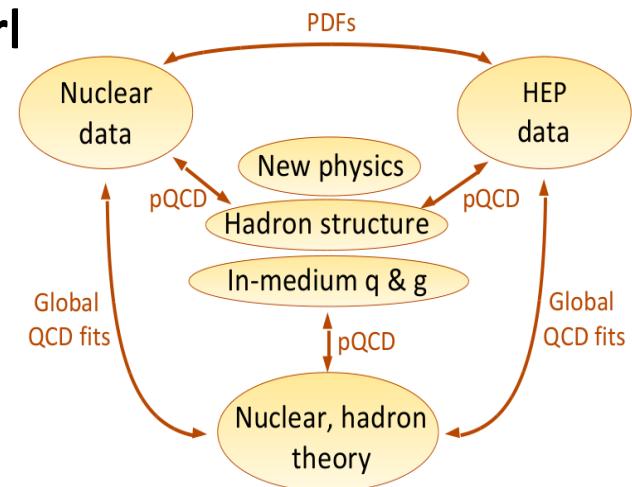

# Conclusions

## □ Entering a new precision era in large-x PDFs

- Most groups are finally on board
  - Much to be learned from each other
- New data (now and in the future), new fitting approaches
- Conquering nuclear corrections – time for threshold resummation ?
- Conquering the world: towards unified PDF+pPDF+FF fits
  - To the benefit of humankind (e.g.,  $\Delta s$ )

## □ High-energy and nuclear physics need to work together

- Progress in hadron / nuclear structure
- Precision PDFs for BSM searches
- Make the most of LHC and JLab 12
- Prepare for the EIC

# Appendix: details on CJ15 fits

# CJ15 - data set

$$W^2 > 3.5 \text{ GeV}^2 \\ \implies x \lesssim 0.85$$

$$\text{BONUS } F_2^n/F_2^d$$

$$x \lesssim 0.65$$

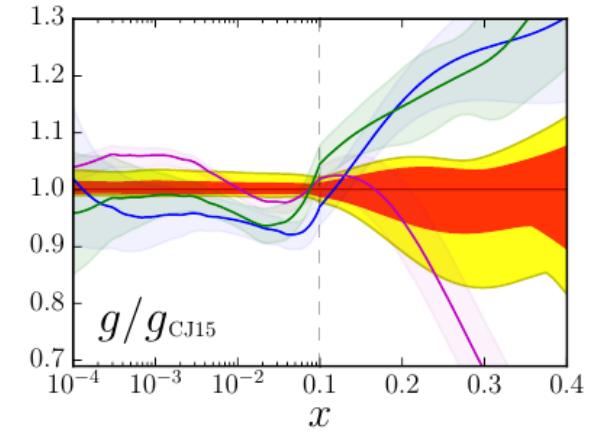

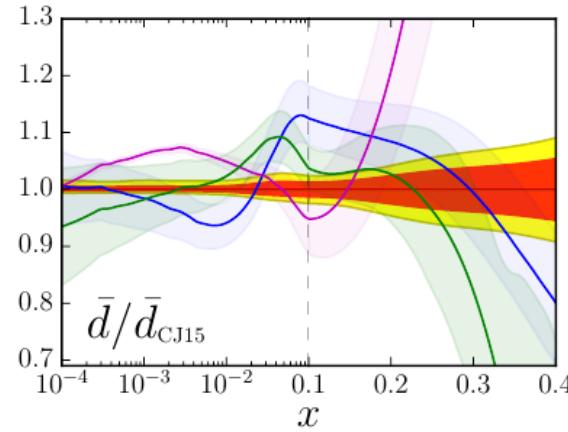

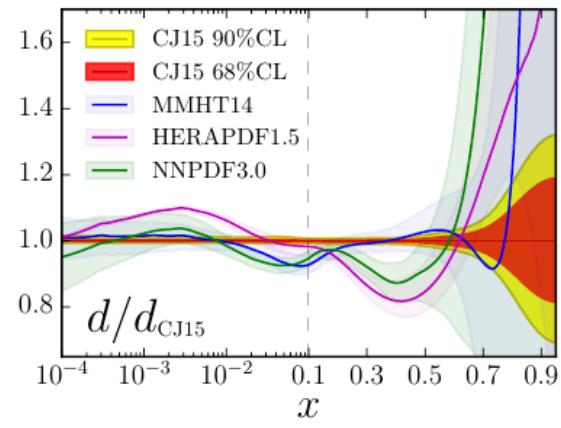

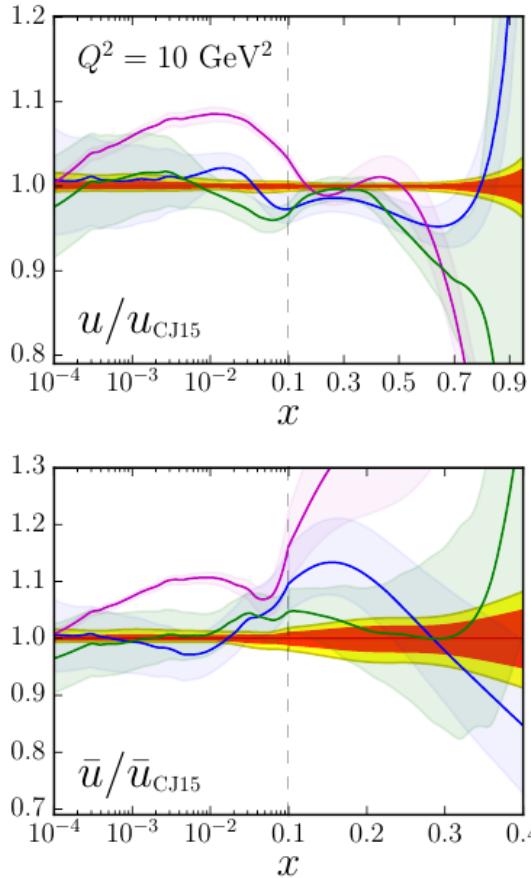

HERA I+II

$$\text{D0 } A_\ell : x \lesssim 0.5$$

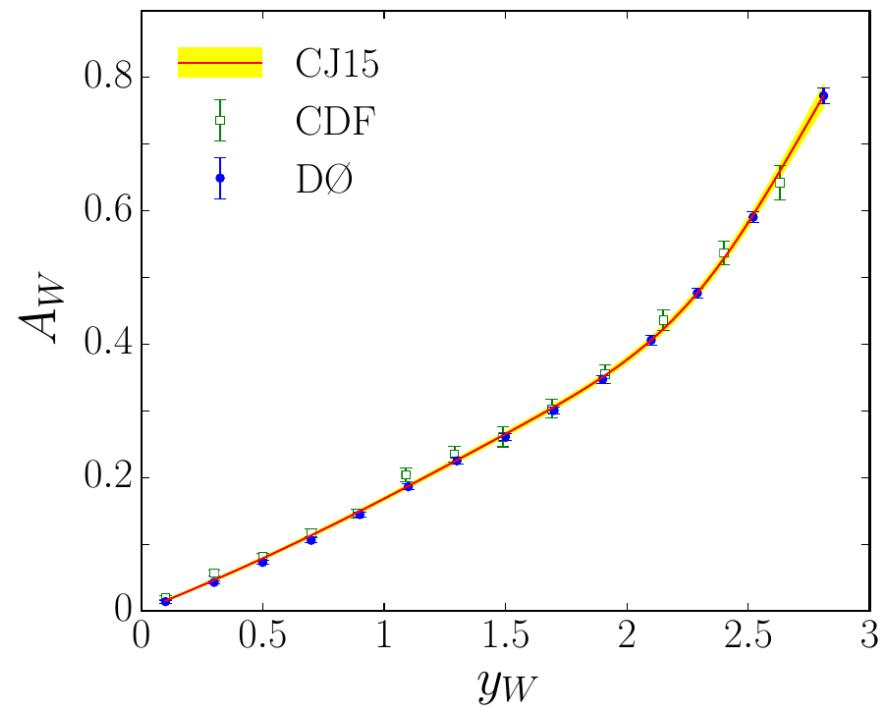

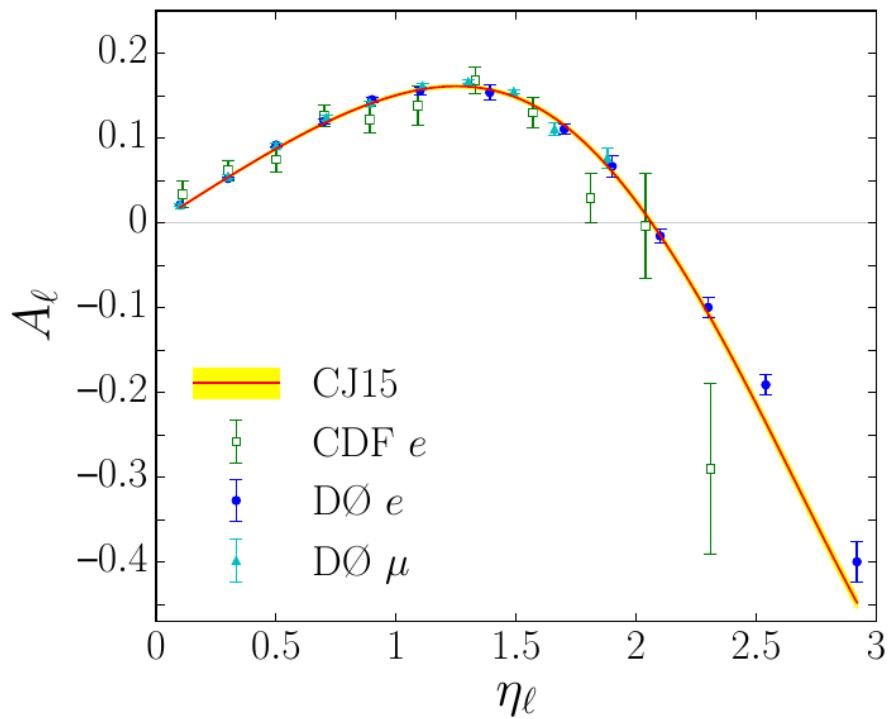

$$\text{D0 } A_W : x \lesssim 0.85$$

# CJ15 vs. others

# $W$ -lepton and $W$ asymmetry at Tevatron

# What fits what?

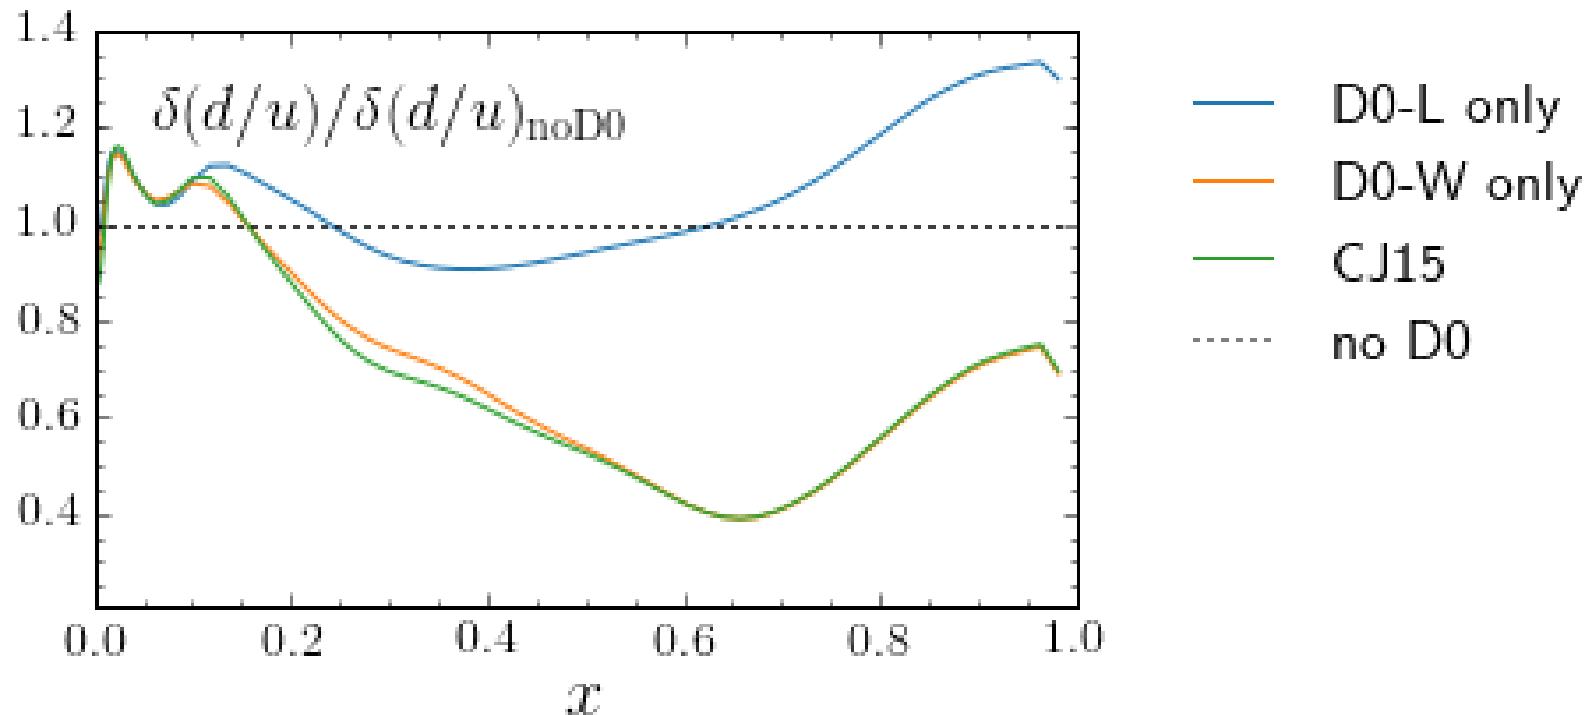

## □ Large $x > 0.3$ :

- D0's W-asymmetry determines the d-quark
- SLAC(d)'s statistical power used to fit the off-shell function

## □ Moderate $x < 0.3$ :

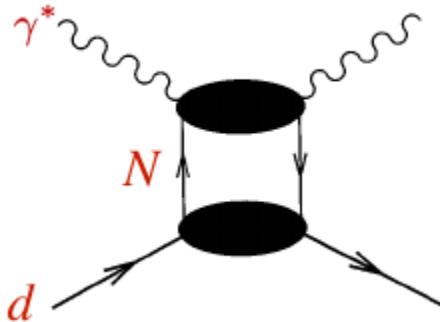

- SLAC(d) enables precise d/u flavor separation

# $W$ -lepton and $W$ asymmetry at Tevatron

# Nuclear corrections

- At large  $x$ , DIS dominated by incoherent scattering from individual nucleons

$$q^d(x, Q^2) = \int \frac{dz}{z} dp^2 f_{N/d}(z, p^2) \tilde{q}^N(x/z, p^2, Q^2)$$

nucleon momentum distribution in  $d$   
("smearing function")

PDF in bound (off-shell) nucleon

$$\rightarrow z = \frac{p \cdot q}{p_d \cdot q} \approx 1 + \frac{p_0 + \gamma p_z}{M} \quad \left[ p_0 = M + \varepsilon, \quad \varepsilon = \varepsilon_d - \frac{\vec{p}^2}{2M} \right]$$

momentum fraction of  $d$  carried by  $N$

$\rightarrow$  at finite  $Q^2$ , smearing function depends on  $\gamma = \sqrt{1 + 4M^2x^2/Q^2}$

- Offshell expansion; parametrize first order coefficient,  $x_1$  fixed with valence sum rule

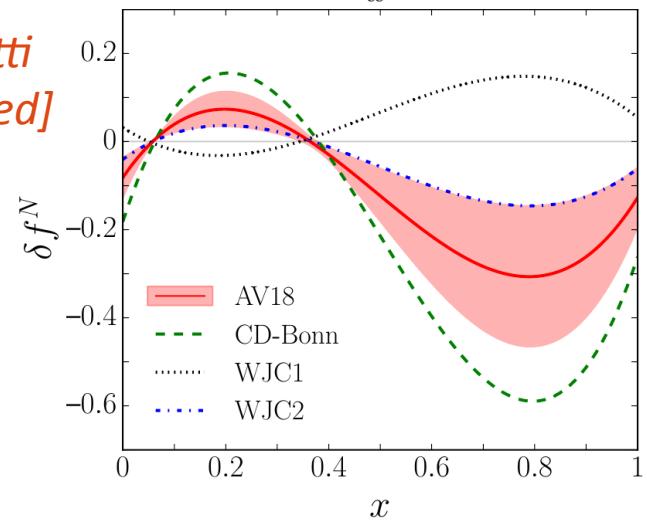

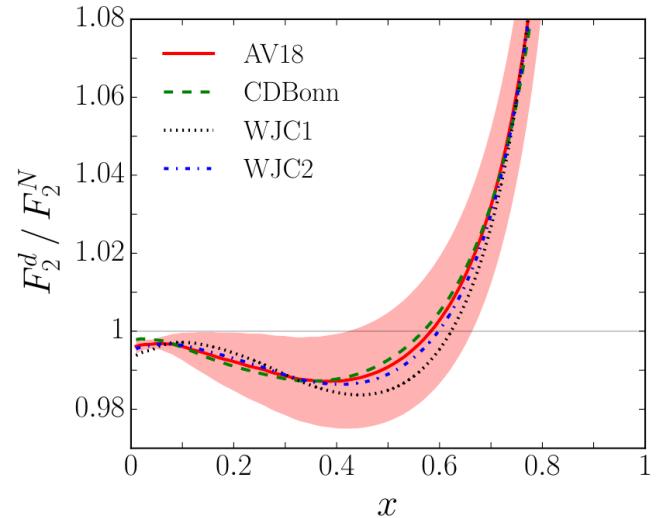

$$\tilde{q}^N(x, p^2) = q^N(x) \left[ 1 + \frac{(p^2 - M^2)}{M^2} \delta q^N(x) \right]$$

$$\delta q^N = C_N(x - x_0)(x - x_1)(1 + x - x_0) \quad \int_0^1 dx \delta q^N(x) (q^N(x) - \bar{q}^N(x)) = 0$$

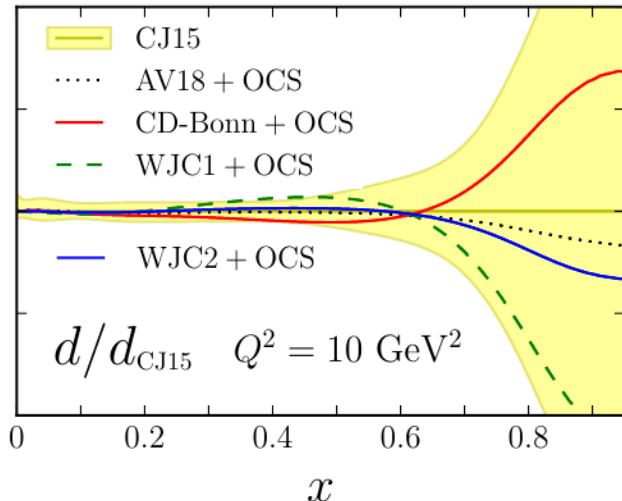

# Nucleon off-shellness constrained by D0 data (!)

- The “wrong” nuclear corrections creates tension between DIS(D) and W asym
  - The fits then chooses the “right” one
- Deuteron to nucleon “EMC” ratio  $D/(p+n)$ 
  - Stable w.r.t. choice of nucleon w.fn.  
(WJC1 disfavored  $\chi^2$ -wise)
  - No evidence for antishadowing
- Off shell correction – first time in Deuteron!
  - Good statistical precision! → also: R. Petti  
[WG1 – Wed]
  - Magnitude compensates for wave function's missing / excessive strength
  - Physical result or fitting away other physics?

$$\delta f^N = C(x - x_0)(x - x_1)(1 + x_0 - x)$$

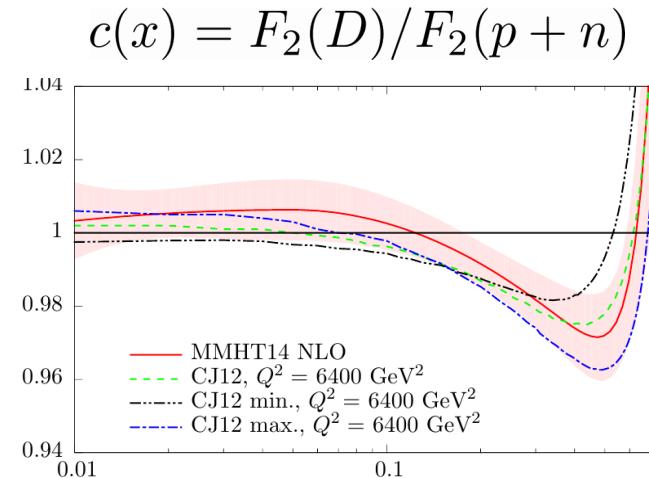

# Cross checks

- Fit with with a 1-parameter model of the off-shell effects
  - Obtain compatible  $d$  quarks

OCS = Off-shell Covariant Spectator model

- MMHT14 parametrize the whole nuclear effect
  - Obtain similar result
  - (but cannot explore the nuclear dynamics)

MMHT14, EPJ C75 (2015) 204

# Hadronic physics output 2: dbar/ubar

- Peng et al. suggest NMC F2 data indicate negative dbar/ubar

J.C. Peng *et al.*, PLB 736 (2014), 411-414

$$\bar{d}(x) - \bar{u}(x) = \frac{1}{2}[u_v(x) - d_v(x)] - \frac{3}{2x}[F_2^p(x) - F_2^n(x)]$$

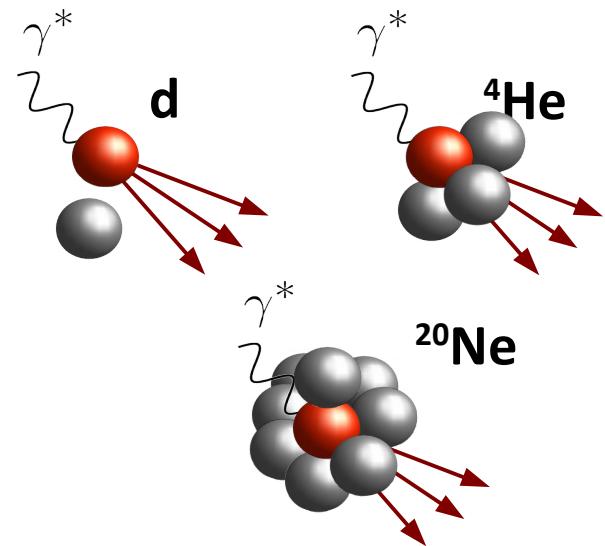

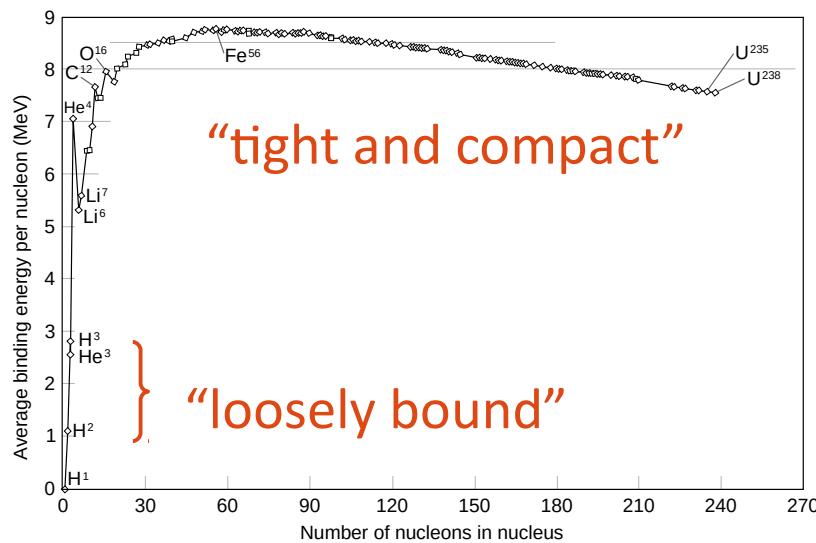

- But extract  $F_2^n$  fwithout accounting for nuclear corrections
- Note also:
  - Ambiguities in choice of valence or total up and down above
  - NLO effects not negligible when dbar/ubar  $\sim 0$

- Using CJ15 fit, can “remove” nuclear effects → Niculescu & Keppel, DIS2016

$$F_2^n \equiv F_2^d(\text{measured}) \times \frac{F_2^n}{F_2^d}(\text{CJ15})$$

# Nuclear physics output

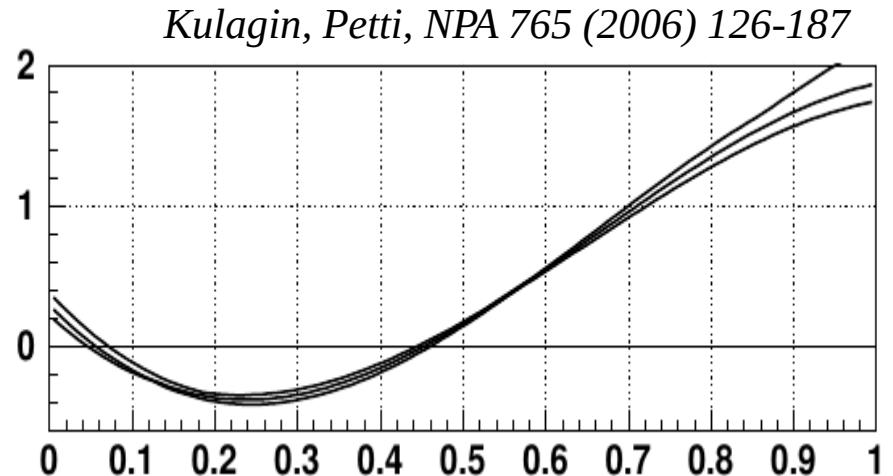

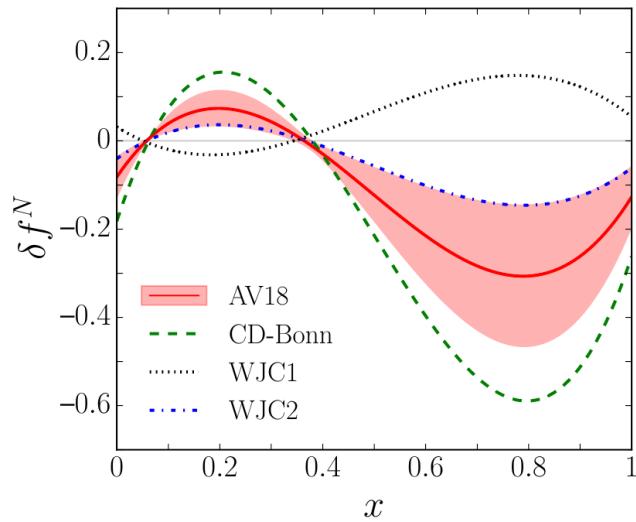

- **QUESTION:** Does the nuclear environment affect the off-shell behavior of a nucleon?
  - For example, partial deconfinement [*Close, Jaffe, Roberts (1985)*]

$$\delta q = \delta q(x; A) ??$$

# Nuclear physics output

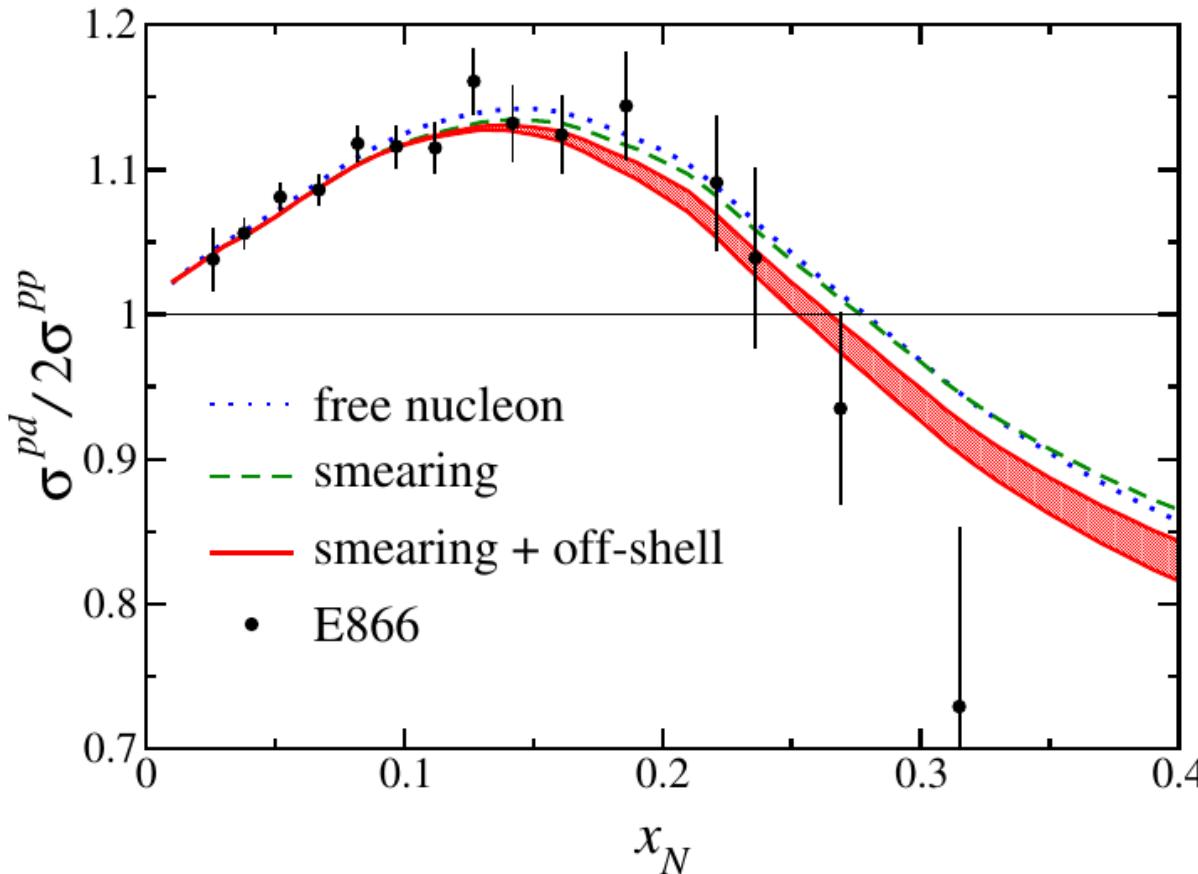

- Compare to Kulagin-Petti fit to e+A collisions
  - Same functional form (but different normalization)

- Different shape and size
  - no nuclear universality ??  $\delta f_N$
  - too hard nuclear spectral function at large momentum ??
  - wrong parametrization? → To be investigated

# Nuclear corrections...

Ehlers, AA, Brady, Melnitchouk, PRD90 (2014)

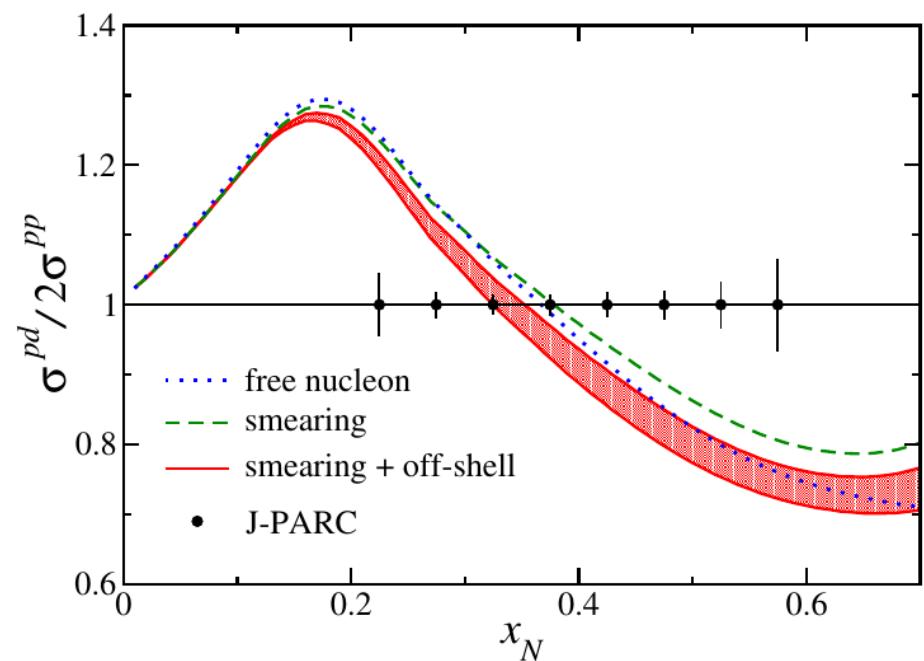

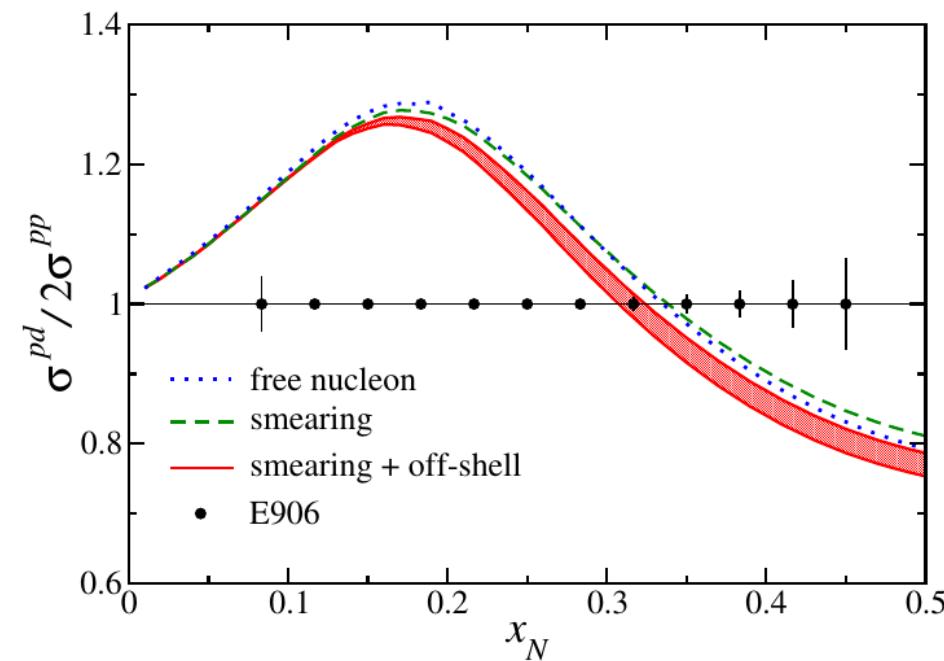

**Red band:**  
combined wave fn.  
& off-shell model  
uncertainty

- Off-shell corrections help make  $\bar{d} - \bar{u}$  stay positive

# Future DY reaches into large-x

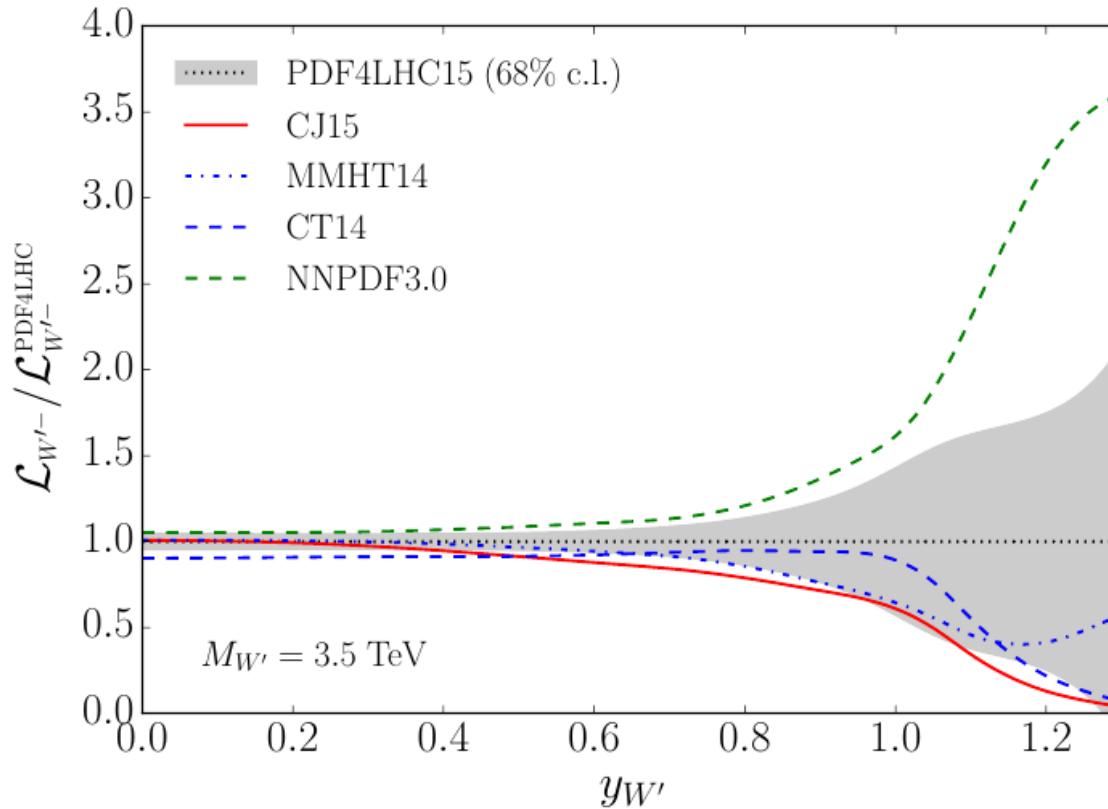

Ehlers, AA, Brady, Melnitchouk, PRD90 (2014)

- **E906/Sea Quest:** off-shell effects even more important
- **J-PARC:** can cross-check nuclear smearing vs. DIS

# BSM physics output

→ see also: R.Placakyte [WG1 – Tue]

$$\mathcal{L}_{W'^-} = \frac{2\pi G_F}{3\sqrt{2}} x_1 x_2 \left[ \cos^2 \theta_C (\bar{u}(x_2) d(x_1) + \bar{c}(x_2) s(x_1)) + \sin^2 \theta_C (\bar{u}(x_2) s(x_1) + \bar{c}(x_2) d(x_1)) \right] \\ + (x_1 \leftrightarrow x_2)$$

# Strangeness and strangeness asymmetry

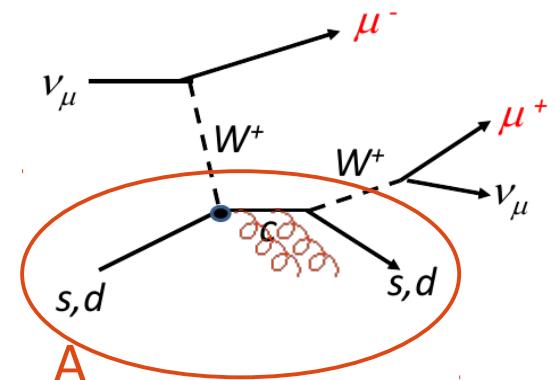

$$s^\pm(x) = s(x) \pm \bar{s}(x) \quad [s^\pm] = \int_0^1 dx x s^\pm(x)$$

- In pre-LHC fits, mostly constrained by  $\nu+A$  data

- CCFR inclusive DIS
  - NuTeV muon pair production
  - NOMAD and CHORUS

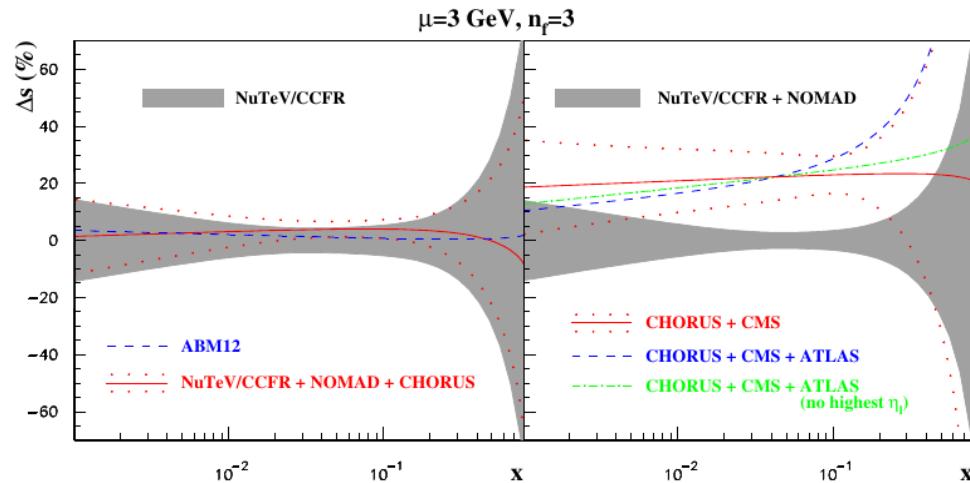

- Nuclear corrections again...

- Initial state nuclear wave-function mods
    - Partly under control using nPDFs
    - But: double counting!! → either use in nPDF or in PDF fits !
  - Final state propagation of the charm quark / D meson
    - Not under theoretical / phenomenological control  
(cf. heavy quark “puzzle” in  $A+A$  at RHIC, LHC)

# Strange tensions

□  $\nu+A \rightarrow \text{dimuons}$  vs.  $p+p \rightarrow W+c$  at LHC      Alekhin et al., arXiv:1404.6469

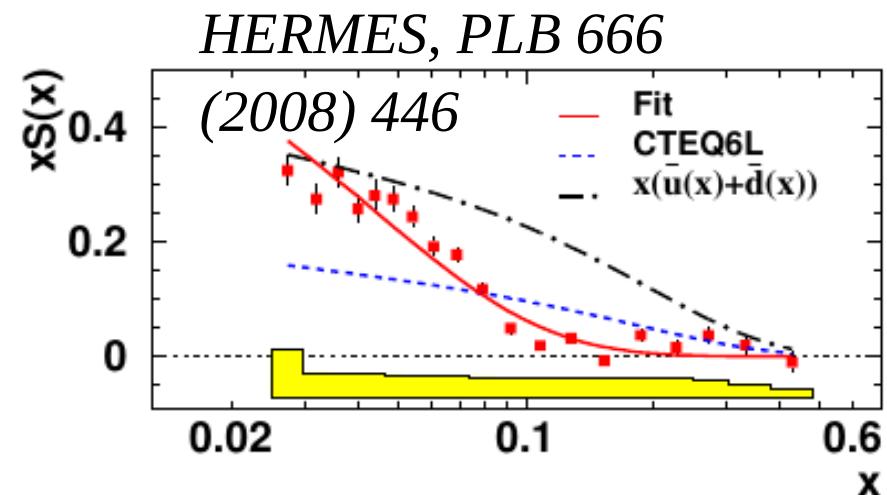

$g s_p \rightarrow W c$

↓  
FSI ?

$\nu s_A \rightarrow \mu^- \mu^+ \nu_\mu s$

□ Kaons in  $e+p$  at HERMES

- But.. fragmentation functions uncertainty

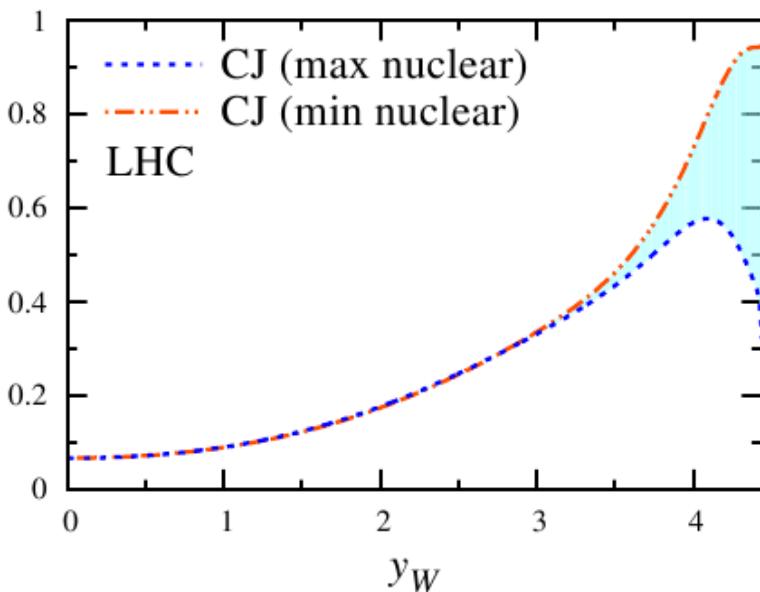

# $W$ charge asymmetry at LHC

Brady, Accardi, Melnitchouk, Owens, JHEP 1206 (2012) 019

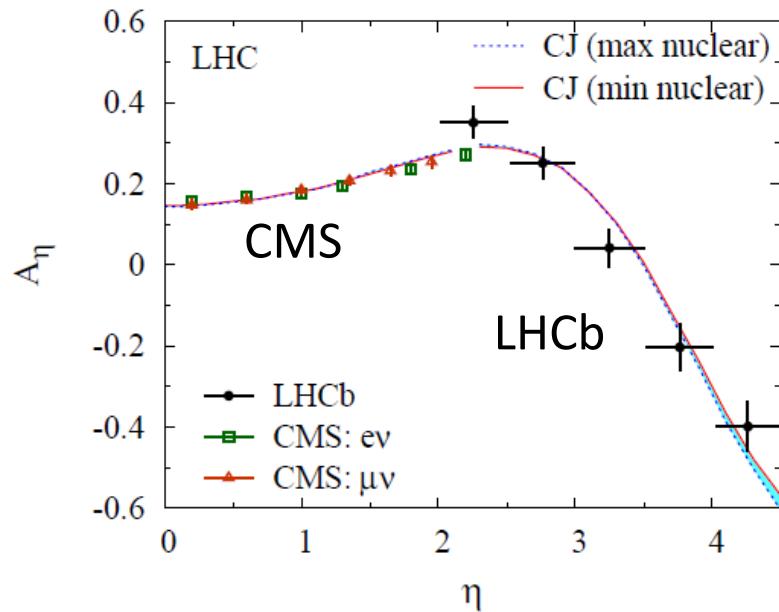

## Directly reconstructed $W$ :

- highest sensitivity to large  $x$

## From decay lepton $W \rightarrow l + \bar{\nu}$ :

- smearing in  $x$

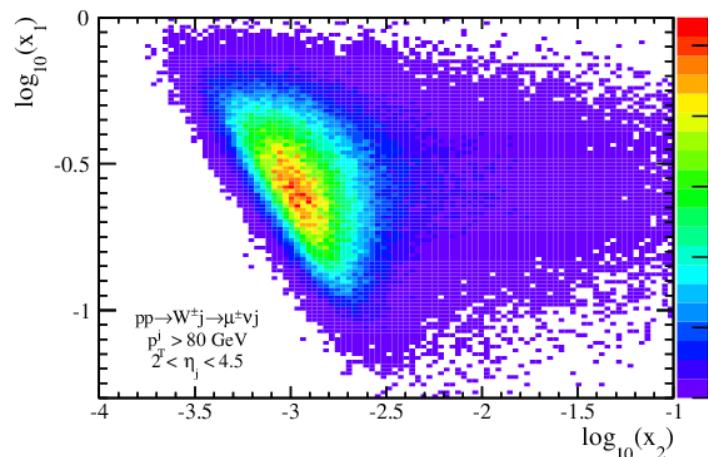

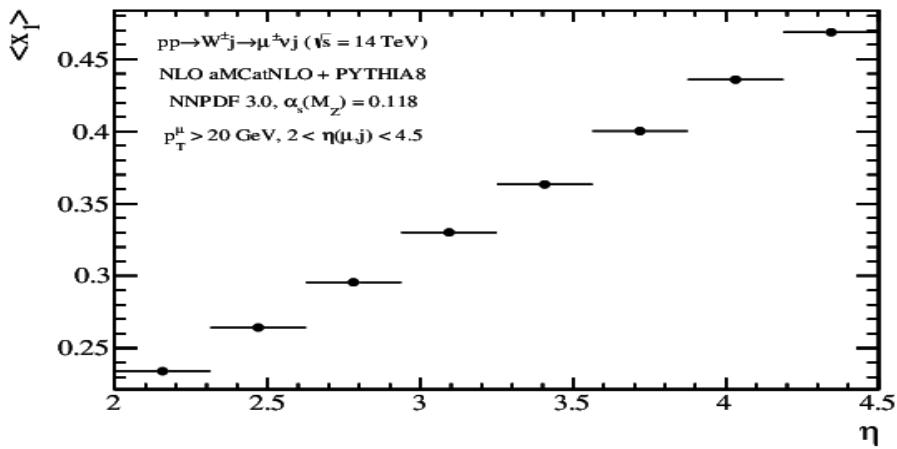

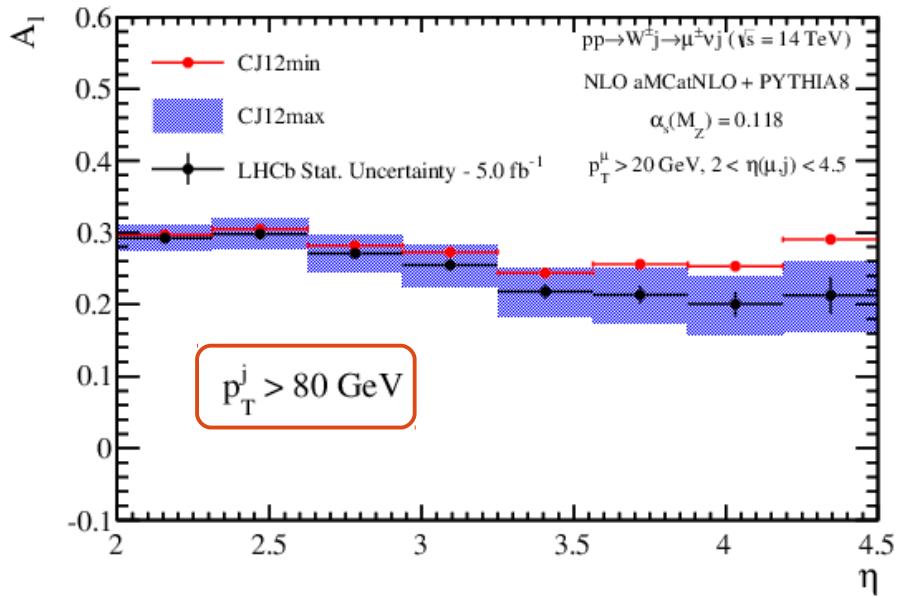

## Would be nice to reconstruct $W$ at

- **LHCb** – But I am told “too many holes”...
- **RHIC** – how high in rapidity?
- **AFTER@LHC ??**

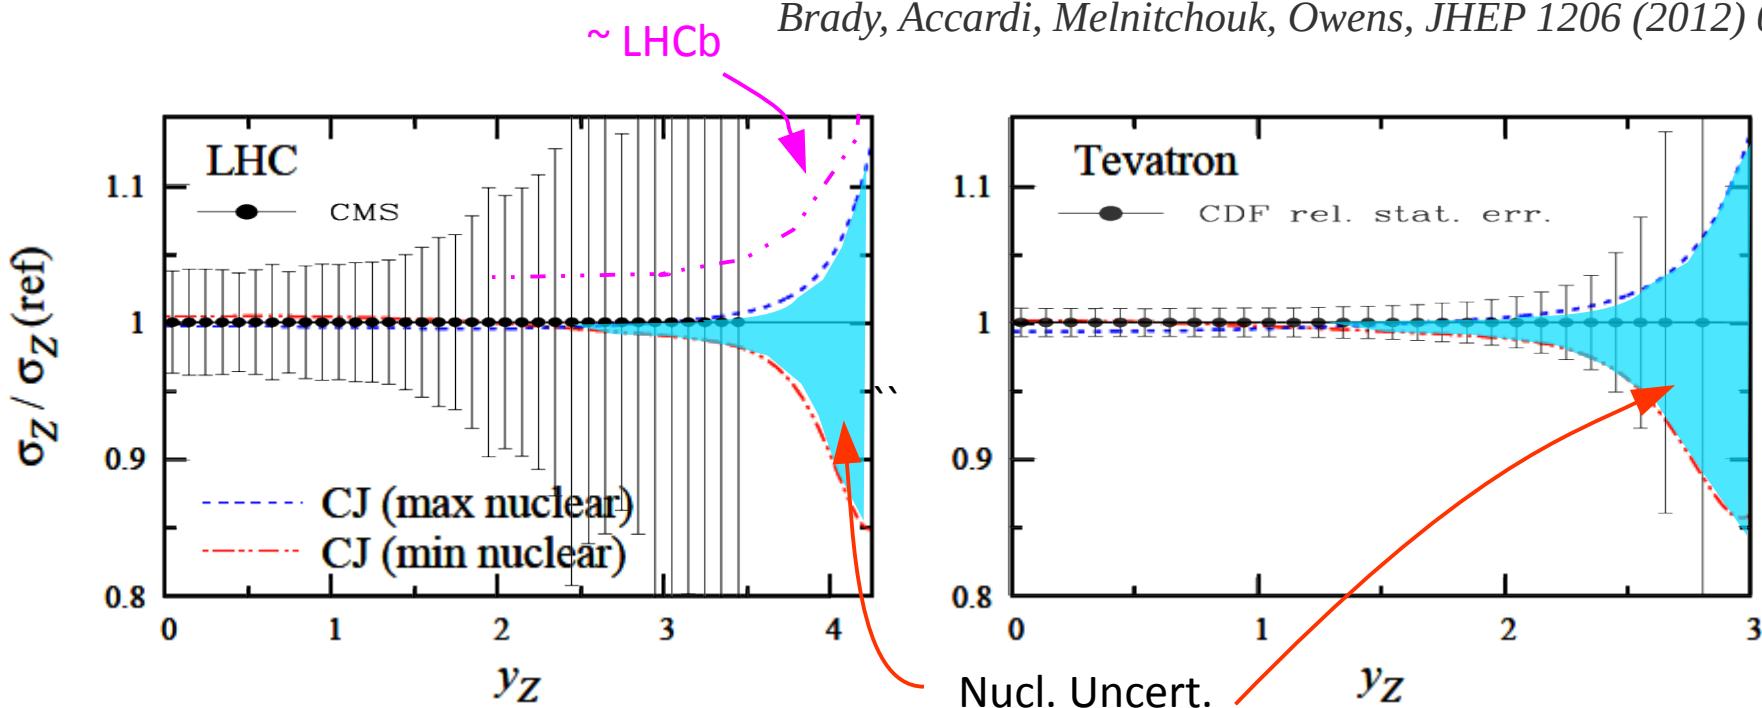

# $W+c$ at LHCb

Farry and Gauld, PRD 93 (2016) 014008

# Z rapidity distribution

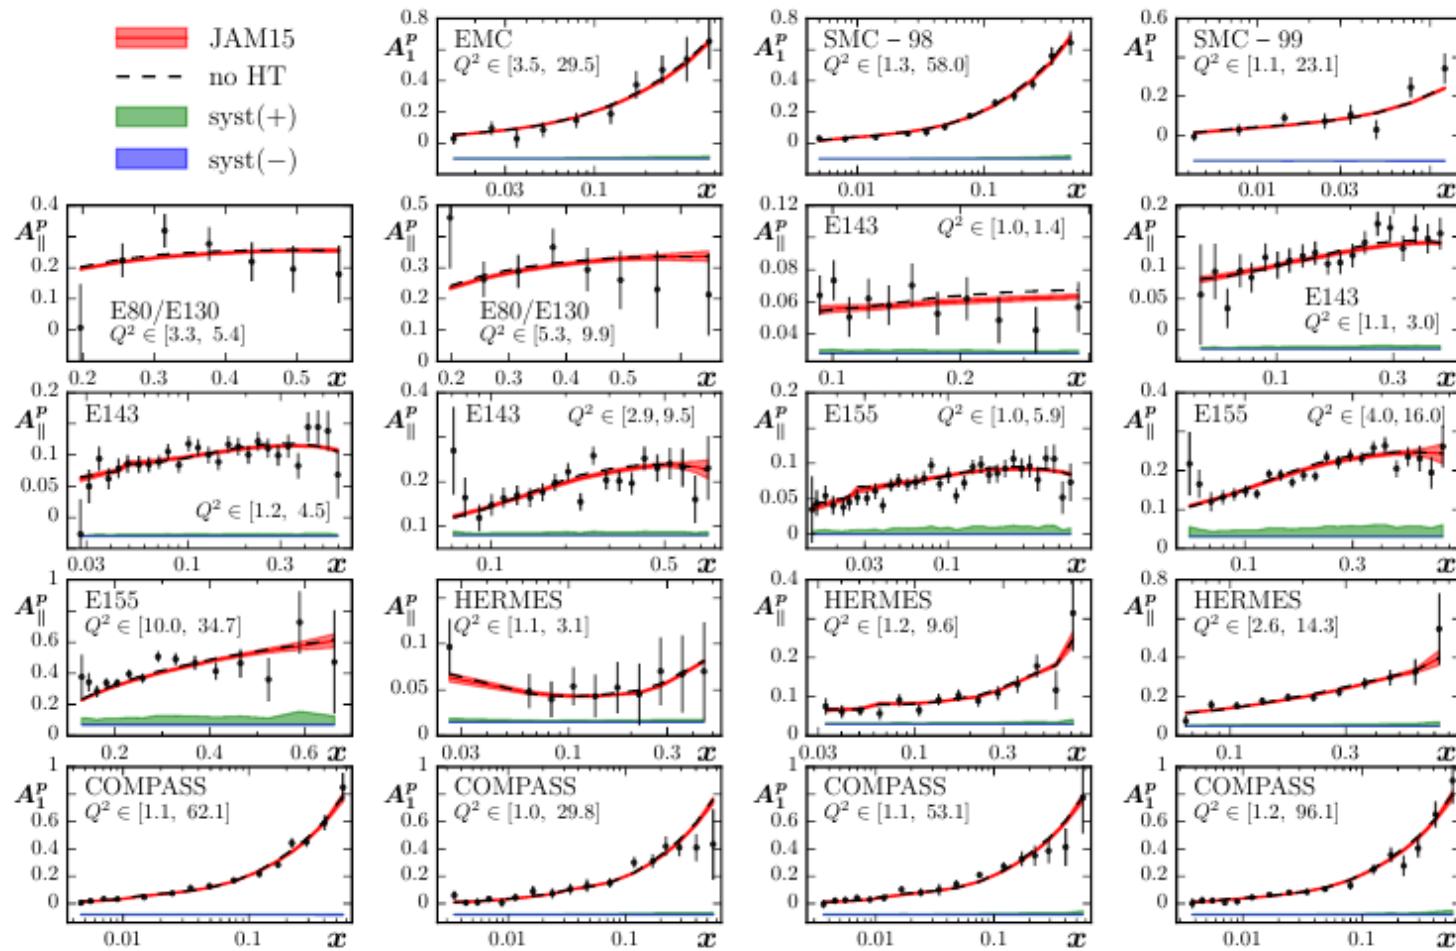

Brady, Accardi, Melnitchouk, Owens, JHEP 1206 (2012) 019

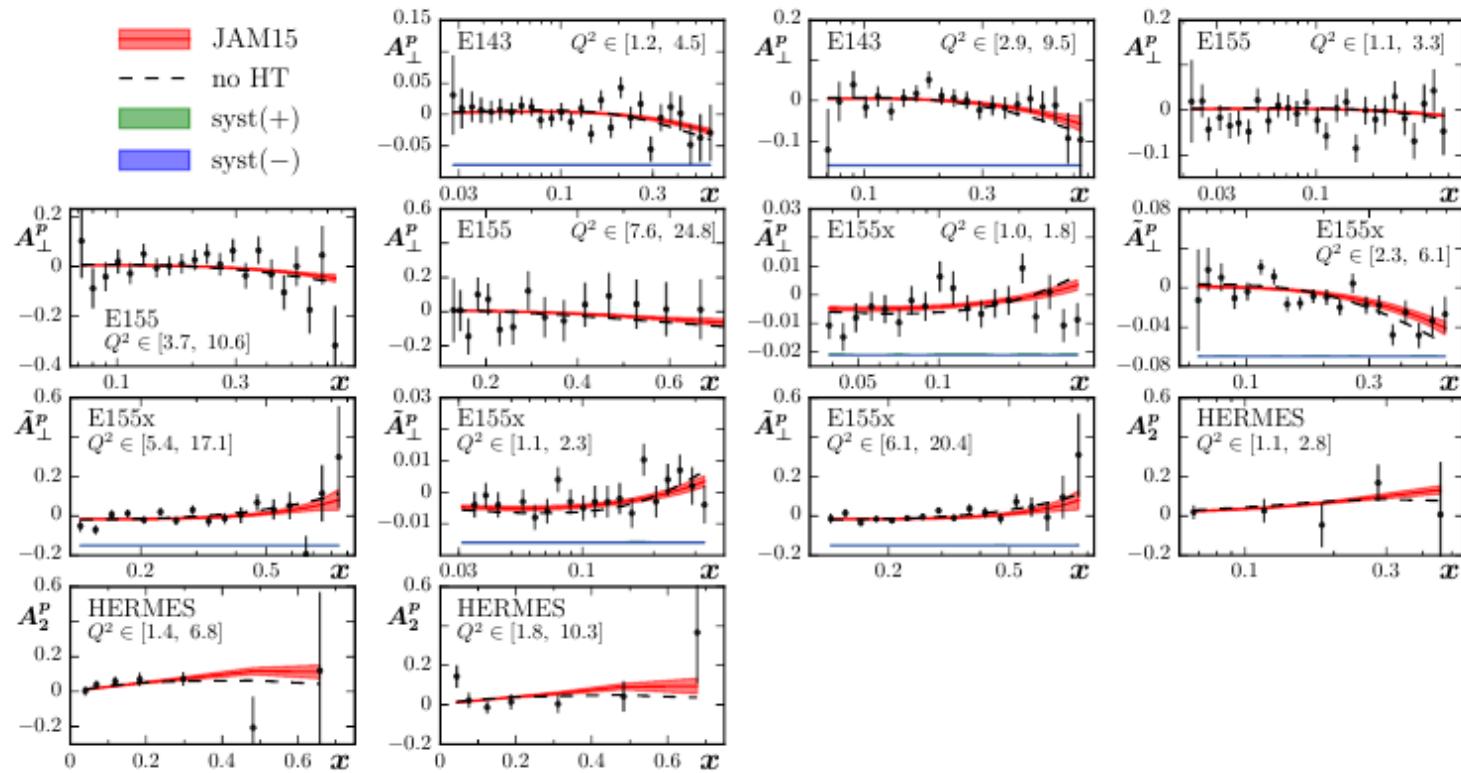

- Direct Z reconstruction is unambiguous in principle, but:
  - Needs better than 5-10% precision at large rapidity
  - Experimentally achievable?
    - At LHCb? RHIC? AFTER@LHC?
    - Was full data set used at Tevatron?

# Appendix: JAM15 polarized PDF

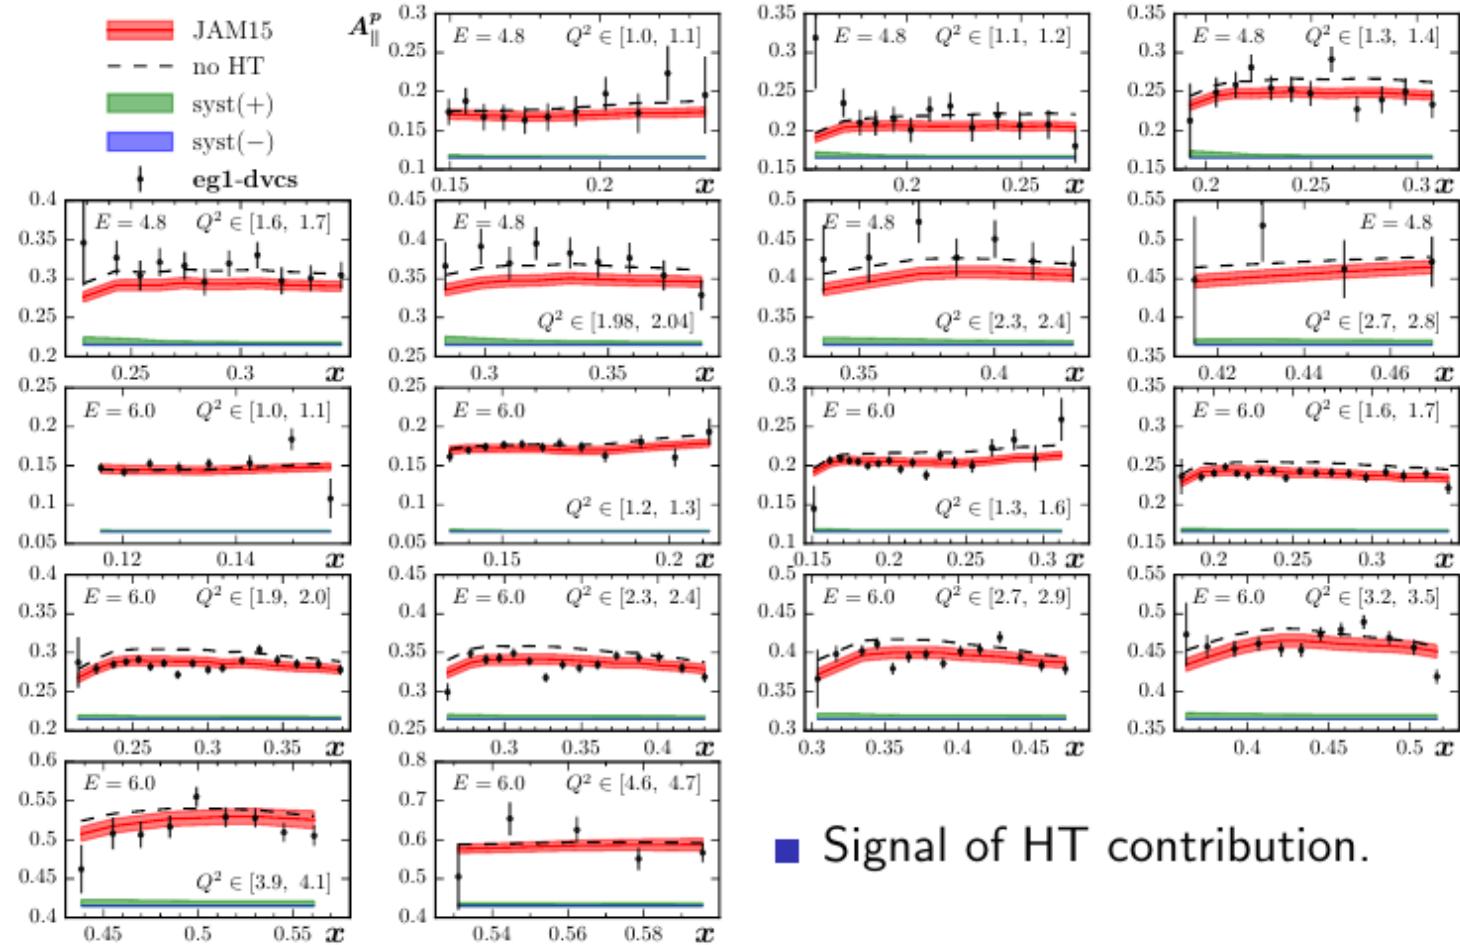

# Data vs. theory: proton

# Data vs. theory: proton

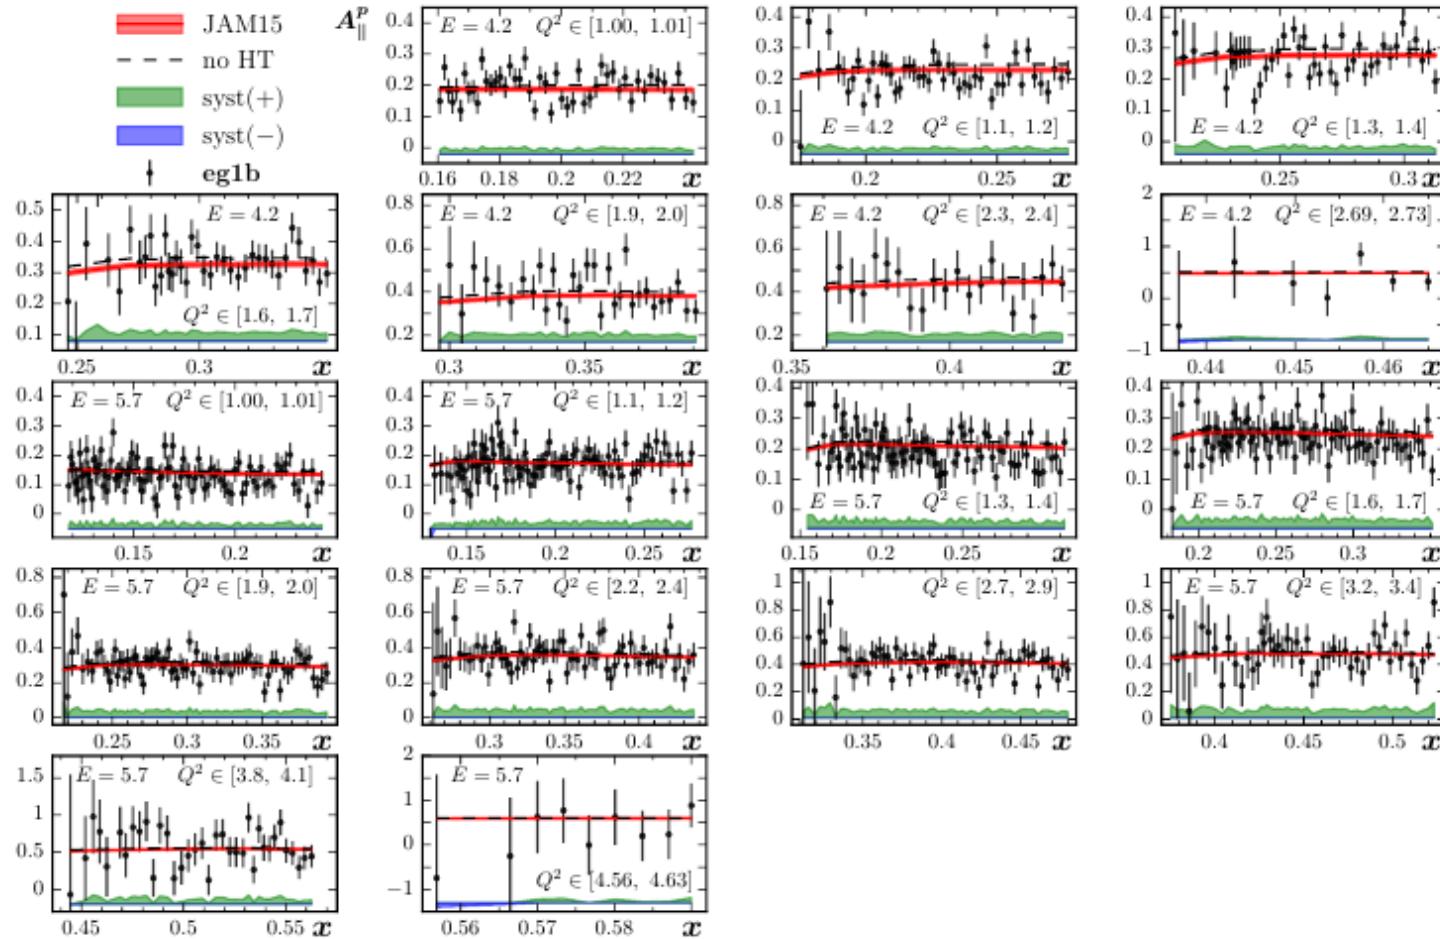

# Data vs. theory: proton EG1b-DVCS

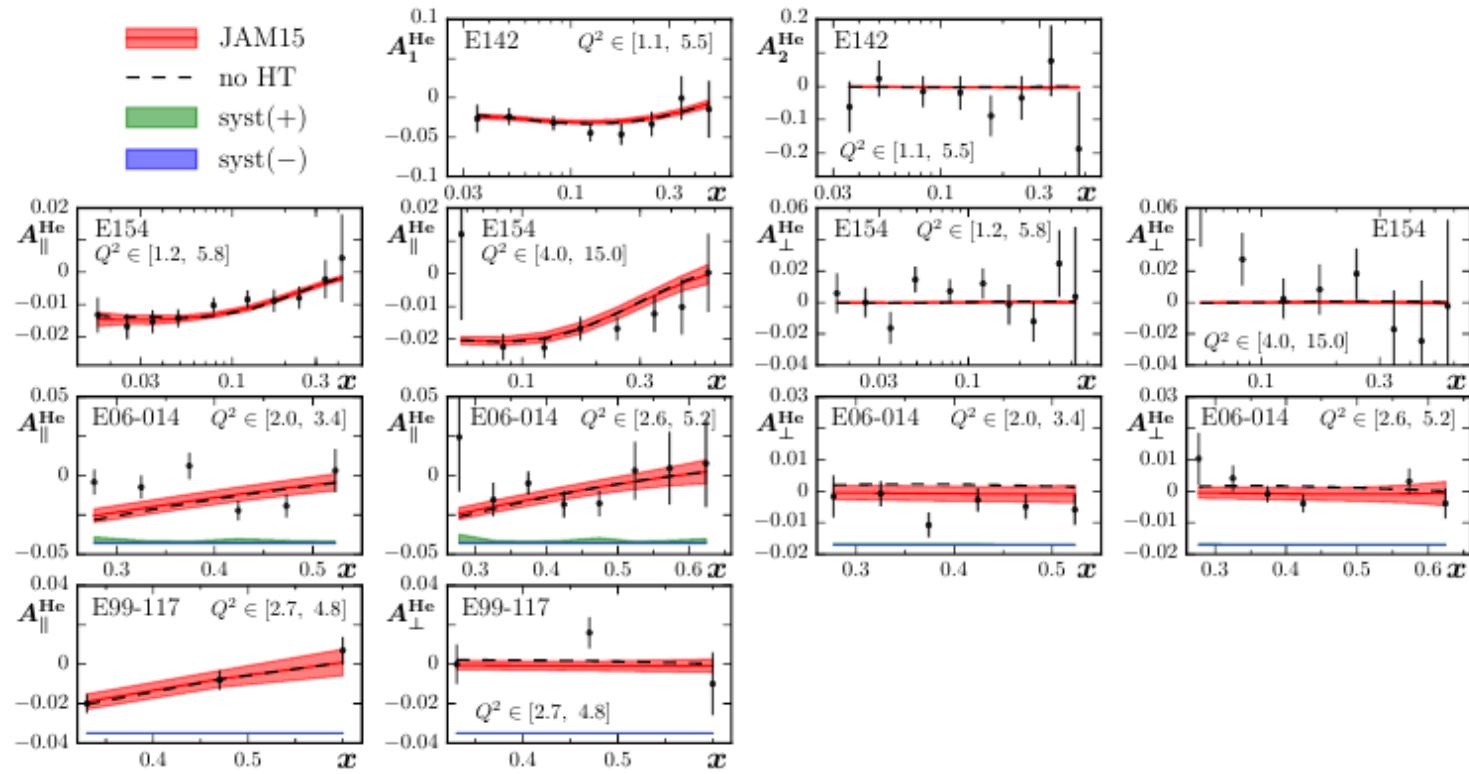

■ Signal of HT contribution.

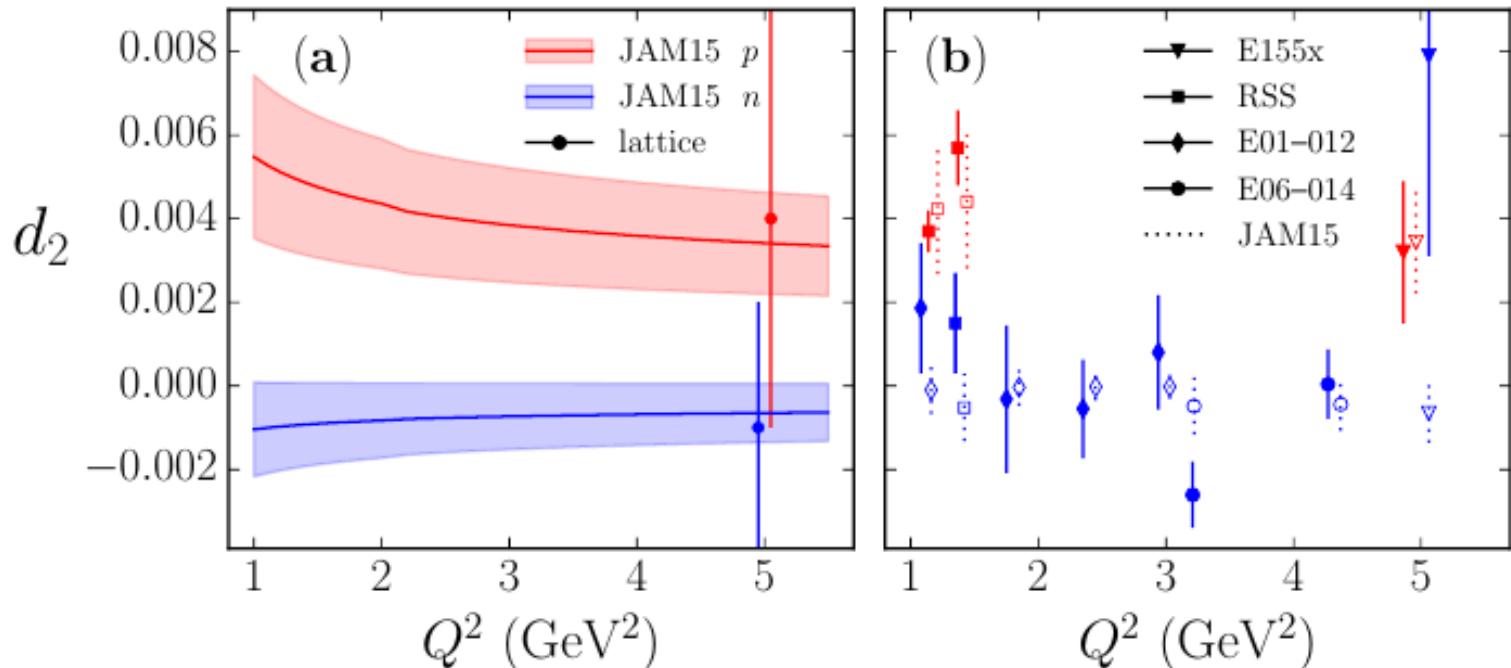

# Data vs. theory: proton EG1b

# Data vs. theory: ${}^3\text{He}$

# $d_2$ matrix element

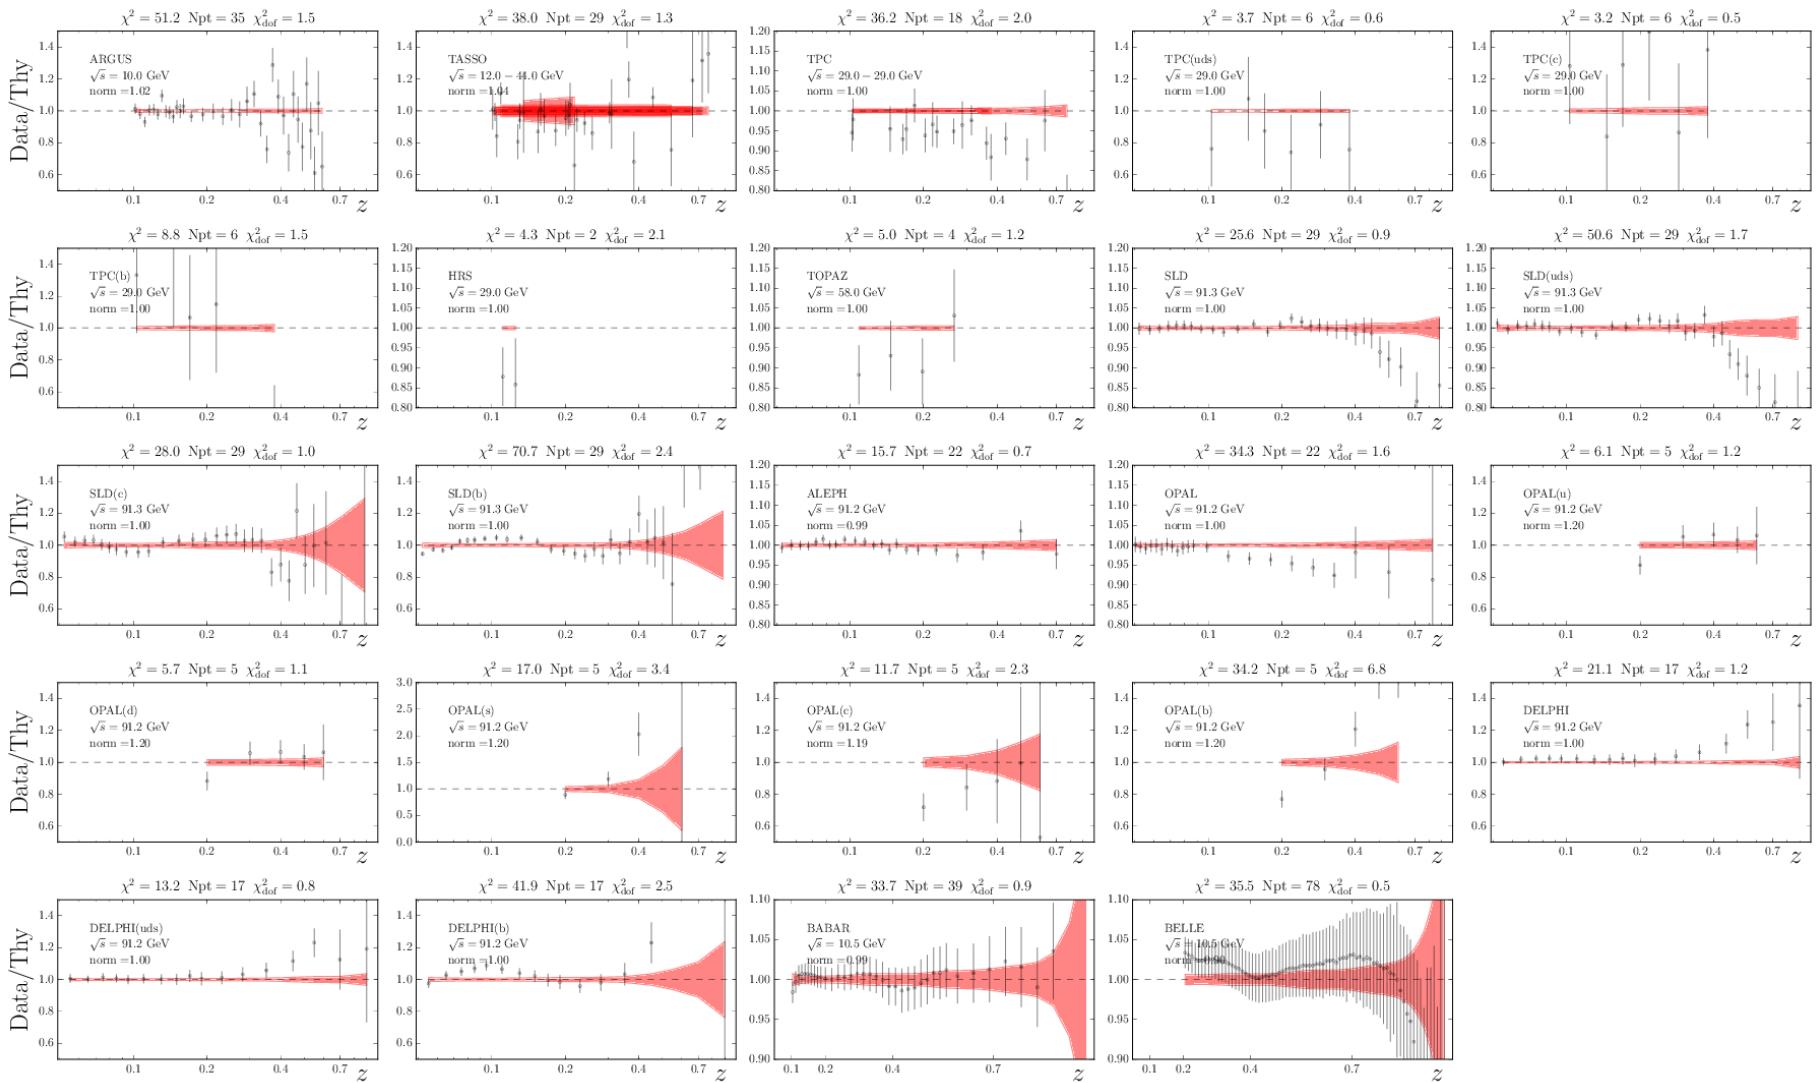

- $d_2(Q^2) \equiv \int_0^1 dx x^2 [2g_1^{\text{T3}}(x, Q^2) + 3g_2^{\text{T3}}(x, Q^2)]$
- $d_2$  is related to “color polarizability” or the “transverse color force” acting on quarks.
- Existing measurements of  $d_2$  are in the resonance region (contains TMC T4 and beyond.)
- Agreement with data indicates quark-hadron duality

# Appendix: Hadron Mass Corrections, HERMES vs. COMPASS

*J.Guerrero, J.Ethier, AA, S.Casper, W.Melnitchouk, JHEP 1509 (2015) 169  
J. Guerrero, A.Accardi, work in progress*

# In brief...

$$M_{\text{exp}}^K(x_B, Q^2) = \frac{\int_{0.2}^{0.8 (0.85)} \frac{dN^K}{dx_B dQ^2 dz_h}}{\frac{dN^{DIS}}{dx_B dQ^2}}$$

Strange quark “tagging”

# Hadron Mass corrections in brief

**With a massive target nucleon, and massive hadron in final state:**

- Respecting partonic 4-momentum conservation  
also requires a “massive” fragmenting parton with  $\tilde{k}'^2 \geq m_h^2/\zeta_h$ .
- $x_B$  and  $z_h$  mixed in the new scaling variables  $\xi_h$  and  $\zeta_h$

**Parton model:**  $M^{K(0)}(x_B, Q^2) = \frac{\sum_q e_q^2 q(x_B, Q^2) \int dz_h D_q^h(z_h, Q^2)}{\sum_q e_q^2 q(x_B, Q^2)}$   
(ignoring mass effects)

**With HMCs:**  $M^K(x_B, Q^2) = \frac{\int dz_h \sum_q e_q^2 q(\xi_h, Q^2) D_q^h(\zeta_h, Q^2)}{\sum_q e_q^2 q(\xi, Q^2)}$

$$\xi_h = \frac{2x_B}{1 + \sqrt{1 + 4x_B^2 M^2/Q^2}} \left(1 + \frac{m_h^2}{\zeta_h Q^2}\right)$$
$$\zeta_h = \frac{z_h}{2} \frac{\xi}{x_B} \left(1 + \sqrt{1 - \frac{4x_B^2 M^2 m_{h\perp}^2}{z_h^2 Q^4}}\right)$$

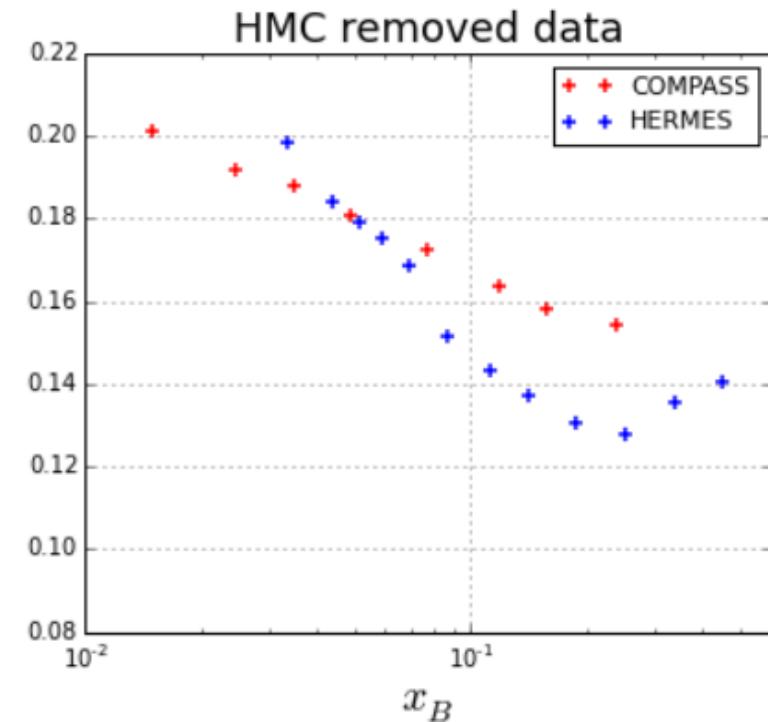

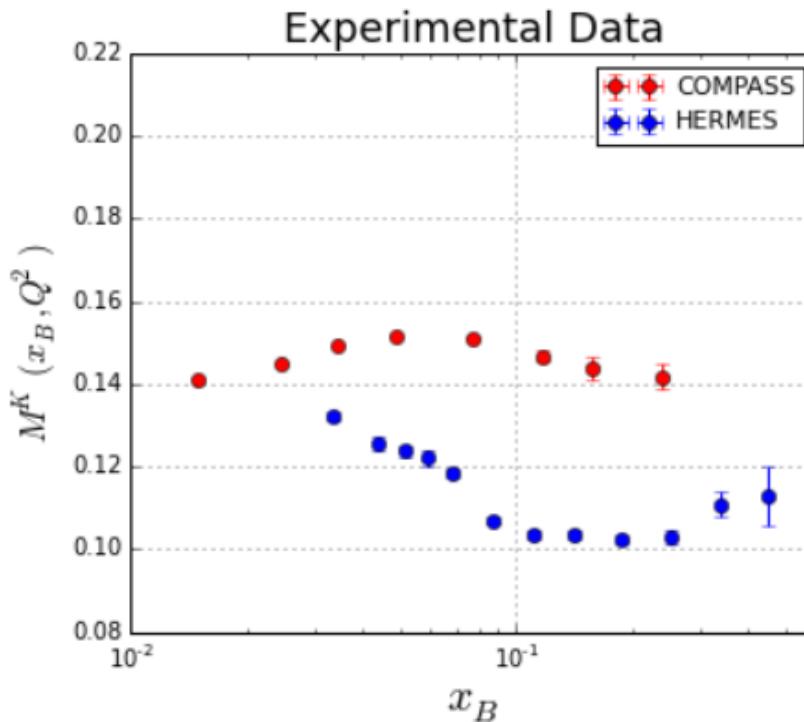

$$Q(x) \equiv u(x) + \bar{u}(x) + d(x) + \bar{d}(x)$$

$$S(x) \equiv s(x) + \bar{s}(x)$$

$$\mathcal{D}_Q^K(z) \equiv 4D_u^K(z) + D_d^K(z)$$

$$\mathcal{D}_s^K(z) \equiv 2D_s^K(z)$$

# COMPASS vs. HERMES

“Remove” HMCs

$$M_{\text{exp}}^{K(0)} \equiv M_{\text{exp}}^K \frac{M^{K(0)}}{M^K} \Big|_{\text{theory}}$$

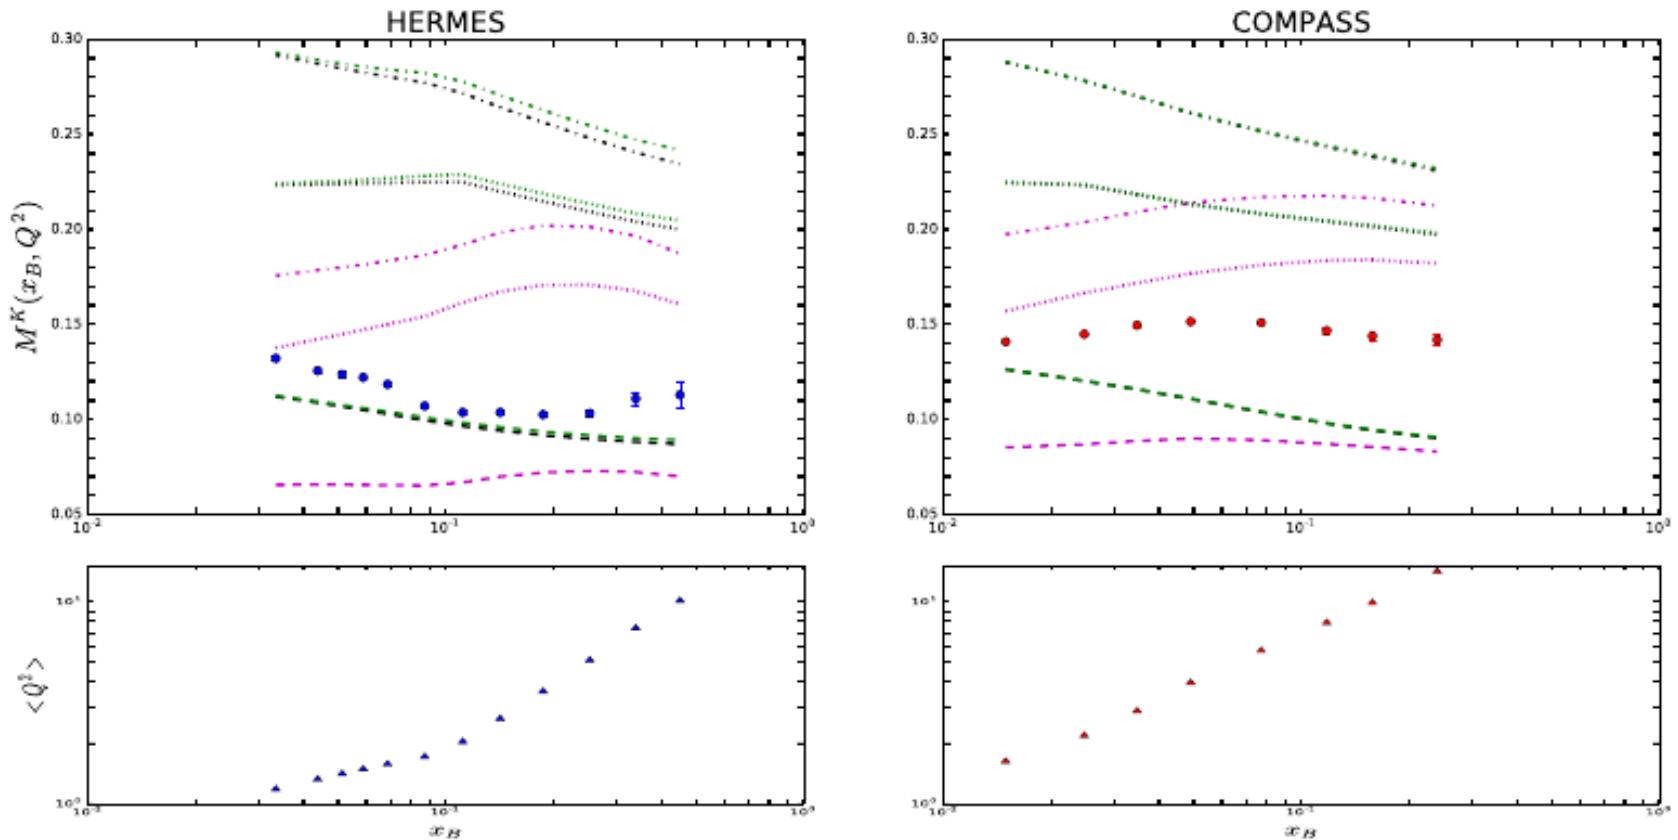

With massless  
hadrons

With HMC

→ data become directly comparable to parton model

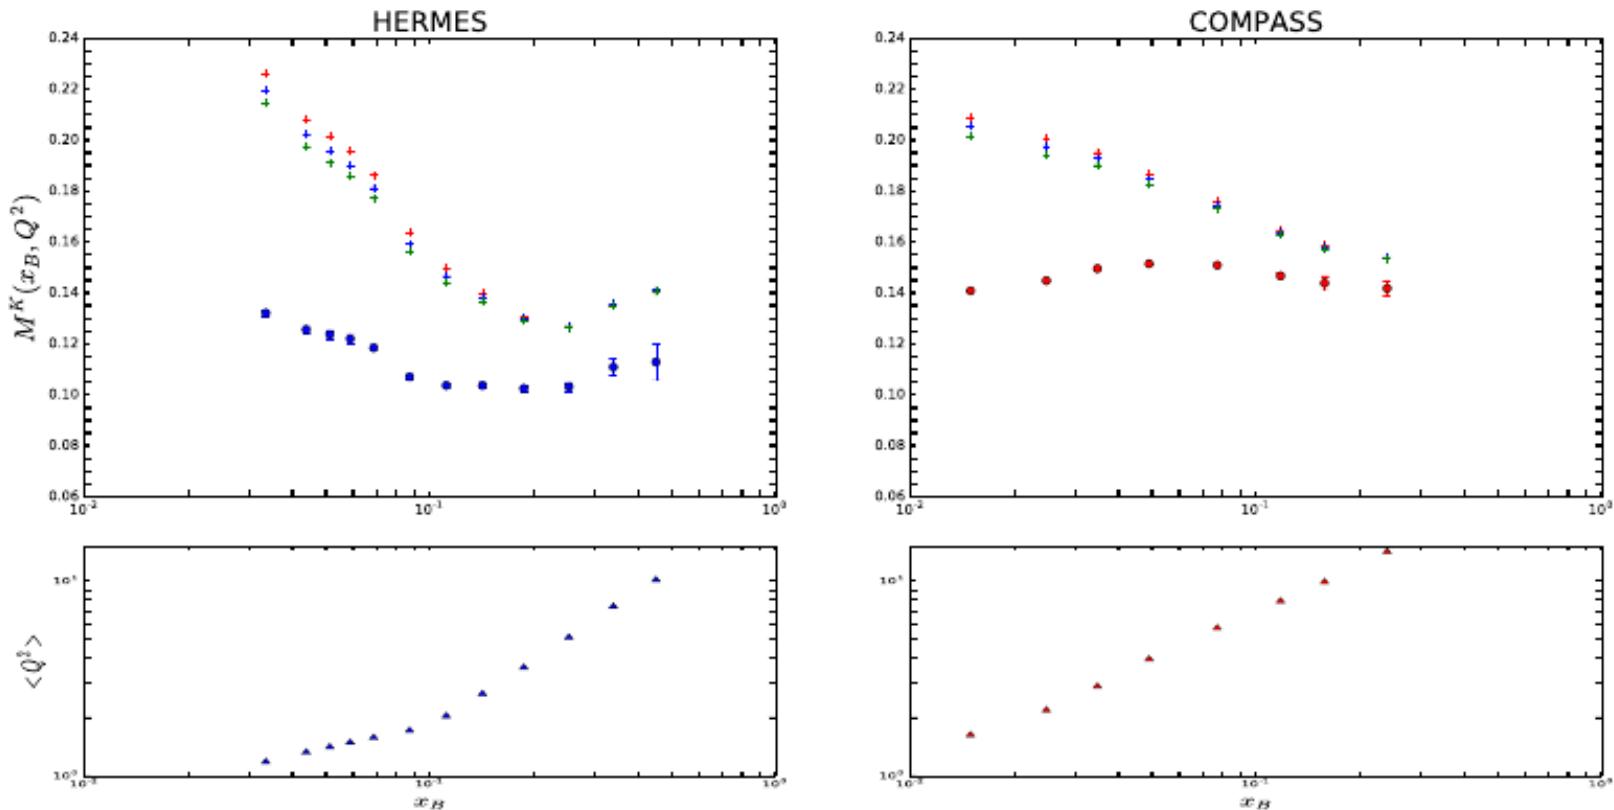

# Fragmentation function systematics

- PDF: CTEQ14
- FFs: DSS (dashed lines), HKNS(dashed-dotted lines), KKP(dotted lines)
- Data (dots) vs. Theory (Bjorken limit, Albino prescription, Our prescription)

# Fragmentation function systematics

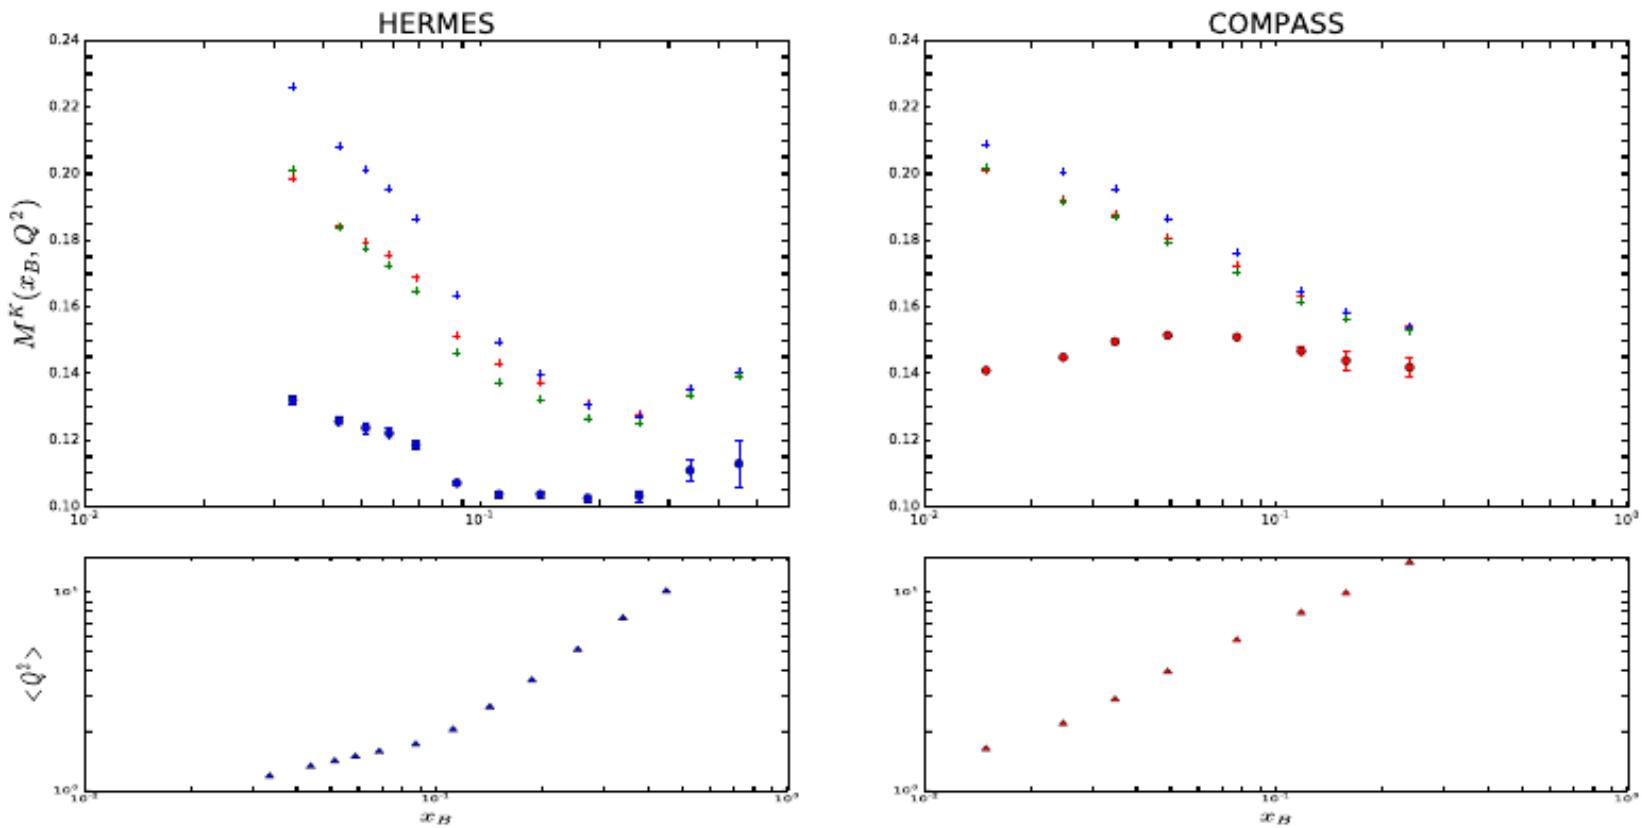

- Parton Level Multiplicities:  $M_{exp}^{K(0)} = M_{exp}^k \frac{M^{K(0)}}{M^K} \Big|_{Theory}$
- Exp. Data (dots) vs. "Partonic" Data (Cross) (**DSS**, **KKP**, **HKNS**)

HMCs “removed” data stable

# Fragmentation function systematics

- Parton Level Multiplicities:  $M_{exp}^{K(0)} = M_{exp}^k \frac{M^{K(0)}}{M^K} \Big|_{Theory}$
- Exp. Data (dots) vs. "Partonic" Data (Cross) ([CT6L](#), [CT14](#), [GJR08](#))

# COMPASS vs. HERMES

Experimental Data

HMC removed data

**HMC effects for kaons may be very large,  
obscure parton dynamics (at first sight)**

**HERMES & COMPASS in rough agreement  
when HMCs taken into account**

(still, what about HERMES L-shaped result,  
that persists also in pion data?)

→ **data become directly comparable to parton model**
