MetaCenter

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- academic grid infrastructure in Czech Republic
- consists of centers at different universities
 - Masaryk University in Brno
 - Charles University in Prague
 - West Bohemian University in Pilsen
 - and at CESNET
- hardware – around 750 CPUs
 - mostly Xeon/Opteron SMP clusters
 - SGI Altix servers
 - Opteron 16way servers
- dedicated network between sites
 - 10Gbps ethernet
 - DWDM – optical network
- participating in EGEE/EGEEII with another 250 CPUs

MetaCenter II

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- software – production grid
 - shared filesystem – AFS
 - shared batch system – PBSPro
 - uniform environment – modules
 - common user management tools – Perun
 - integrated monitoring – Ganglia
- usual grid motivation
 - sharing resources
 - load balancing of jobs
 - redundancy and robustness
 - allow cooperation among scientists from different universities
 - allow experiments which exceed borders of one site

Virtual machines

Grid and virtual machines

Miroslav
Ruda, Jiri
Denemark

Motivation

Virtual machines

Future plans

- virtual machines can provide
 - several machines, with different OS or Linux flavor on the same machine
 - migration
 - suspend/resume
- could enhance MetaCenter (or general grid) in several ways
 - migration \Rightarrow better scheduling, robustness
 - suspend/resume \Rightarrow checkpointing
 - different OS or Linux flavor \Rightarrow interactive jobs
 - different flavors of hardware \Rightarrow compatibility with new software
 - different flavors of software \Rightarrow support different grid

Virtual machines

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- virtual machines can provide
 - several machines, with different OS or Linux flavor on the same machine
 - migration
 - suspend/resume
- could enhance MetaCenter (or general grid) in several ways
 - migration \Rightarrow better scheduling, robustness
 - suspend/resume \Rightarrow checkpointing
 - CPU/memory allocation \Rightarrow interactive jobs
 - several virtual domains \Rightarrow possibility to run different images for different groups, support different grid middleware
 - isolation \Rightarrow provide illusion of dedicated cluster

Studied use-cases

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- portability tests, running services in different Linux distributions
- sharing of one machine by several services – service consolidation
- different Linux flavors running on the same worker node – EGEE/MetaCenter integration
- preemption, interactive jobs

Elementary usage

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- running different Linux distributions on the same machine
 - environment for software development
 - for portability tests (EGEE LB service)
 - for simulation of distributed environment
 - some software may require specific Linux distribution
- usually first use-case, very useful to familiarize with virtual machines tools
- in our case Xen, Vserver and OpenVZ

Xen vs. Vserver

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- Xen – paravirtualization
 - useful for complete encapsulation
 - support for complete Linux distributions
 - perfect solution for service consolidation
 - may not be necessary for worker nodes, but currently used for EGEE/MetaCenter integration
- Vserver – one kernel space
 - higher number of virtual machines with small overhead
 - useful when just one or few services must be running – perfect for development machine
 - may be better solution for preemptive use-case (two domains of the same flavor)
 - better on NUMA architecture
- adoption curve similar, with slightly different problems
 - Xen – kernel modules, AFS
 - Vserver – standard system daemons, INADDR_ANY binding, loopback

Xen performance results

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- good results on small SMP machines – minimal delay for CPU, memory, disk intensive applications
- bad results for fast networks – one CPU is required for bridging on full speed gigab ethernet
- bad NUMA support – on 16way Opteron machine slowdown from 5 to 13 minutes
- initial tests with the HVM not encouraging

Xen performance results

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- active use of memory
 - dom0
 - every running domU needs at least 100MB
- disk partitions dedicated to different VMs
 - not easy (read-only) sharing of root filesystems
 - required splitting of scratch partitions
- fast network can be dedicated to one domU or bridged

Service consolidation

Grid and
virtual
machines

Miroslav
Ruda, Jiri

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage
Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- primary motivation – efficient use of hardware
 - EGEE in a box
 - 7 domains running all EGEE services in different VM (WMS, LB, Myproxy, VOMS, CE, WN ...)
 - different EGEE service require different setup, packages, are not compatible
 - used for certification and pre-production testbed
 - but also for production WMS for the VOCE
- 2xXeon 3.0GHz (4 CPUs with HT), 6 GB RAM, 2x150GB disk
- Xen is perfect solution, overhead is minimal
 - all services running all the time, statical splitting of memory is OK
 - root filesystem is different for different domains

EGEE/MetaCenter integration

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- primary motivation – allow coexistence of EGEE and MetaCenter environments
- two images running all the time – Debian/OpenSuse (MetaCenter) and SLC (EGEE)
- EGEE gateway (Computing Element) submits to standard PBS, but to special queue
- dynamic allocation of resources to EGEE and MetaCenter maintained by PBS
- PBS must be aware that two VMs share the same node, but with minimal changes on PBS side ⇒ Magrathea project
- no changes to EGEE software

Magrathea

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage
Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- integrating virtual machines and PBS
 - each node can run several VMs at a time
 - at most one VM on each node is active
 - however, a VM can be activated even if another one is active – preemption
 - active VM is provided with “all” physical memory and CPU power
- implementation
 - PBS cannot recognize real machines from virtual ones
 - special PBS attribute to distinguish amongst free, running and occupied machines
 - modified PBS scheduler schedules jobs to free machines only
 - current state of VMs is maintained by a daemon running on each physical machine

Magrathea – implementation

Grid and

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- primary motivation – adding support for interactive jobs to MetaCenter
 - new class of users who cannot use batch mode
 - new functionality for current users
- two Debian/OpenSuse images running all the time, second accessible only by privileged jobs
- when privileged job is coming, standard domain is
 - suspended – not used now
 - node/job is down for PBS
 - problem with parallel jobs
 - given only small fraction of CPU, small real memory
 - currently usable only for sequential jobs, support for parallel jobs will require migration and support on scheduler

1 Motivation

- MetaCenter
- Virtual machines

2 Current usage of virtual machines

- Elementary usage
- Service consolidation
- EGEE/MetaCenter integration
- Job preemption, interactive jobs

3 Future plans

- Deployment issues
- Short term plans
- Long term plans

Deployment issues \Rightarrow motivation for new research

Grid and

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter

Virtual machines

Current usage
of virtual
machines

Elementary usage

Service consolidation

EGEE/MetaCenter
integration

Job preemption,
interactive jobs

Future plans

Deployment issues

Short term plans

Long term plans

- imagine, that number of your machines grow 5x
 - you will be out of public IP address \Rightarrow IPv6 deployment, (private network, VPN)
 - any solution with scalability problems will become bottleneck
 - installation/management tools for clusters
 - monitoring
 - user management
 - you may find problem with licensed software
- image management \Rightarrow Workspaces integration?
- Infiniband available only in one virtual machine \Rightarrow ??
- security implications – separation of different domains, user supplied images
- monitoring/benchmarking

Short term future plans

Grid and
virtual
machines

Miroslav
Ruda, Jiri
Denemark

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage
Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- Magrathea extensions
 - more then two virtual domains
 - not all domains running
 - fine-grained resource allocation – virtual domains per job
- improved support for job preemption – parallel jobs
- more flexible EGEE/MetaCenter integration
- better integration with batch system – management of virtual machines
- minimization of overhead
 - Xen
 - memory
 - shared filesystem for several domains
 - shared scratch filesystem – PVFS2?
- Vserver and IPv6

Long term future plans

Grid and
virtual
machines

Miroslav
Ruda, Jiri

Motivation

MetaCenter
Virtual machines

Current usage
of virtual
machines

Elementary usage
Service consolidation
EGEE/MetaCenter
integration
Job preemption,
interactive jobs

Future plans

Deployment issues
Short term plans
Long term plans

- efficient sharing of high speed interfaces
- monitoring
 - monitoring and management of hosting VM (dom0)
 - monitoring of services in user VMs, including their batch system
- scheduling support
 - scheduling using features provided by VMs – suspend, checkpointing, migration
 - hierarchy of schedulers is more complicated (meta, batch, workspace, VM, OS scheduler)
- migration
 - local filesystem
 - cooperation with scheduling
- model
 - two planes – real and virtual
 - dynamic mapping of virtual machines to real resources
