

Advances using Intel processor technology

Thursday 8 December 2016 11:30 (15 minutes)

Intel processor based AdvancedMC modules are mainly used for management and control purposes. These boards possess a number of additional capabilities that can provide useful performance gains and enable the Intel based resources to be used for some data processing. In particular, the presentation will show what can be achieved using virtualisation and GPU acceleration.

The presentation will also cover a general roundup of other features that may be interesting for some applications
