

Anmerkungen zur Theorie

Dieter Zeppenfeld
KET Treffen, Bad Honnef, 19.11.2016

KIT Center Elementary Particle and Astroparticle Physics - KCETA

Teilchentheorie: Standorte in Deutschland

Einige Standorte mit mehreren Gruppen

Total numbers of theorists in Germany
(according to 2013 KET poll)

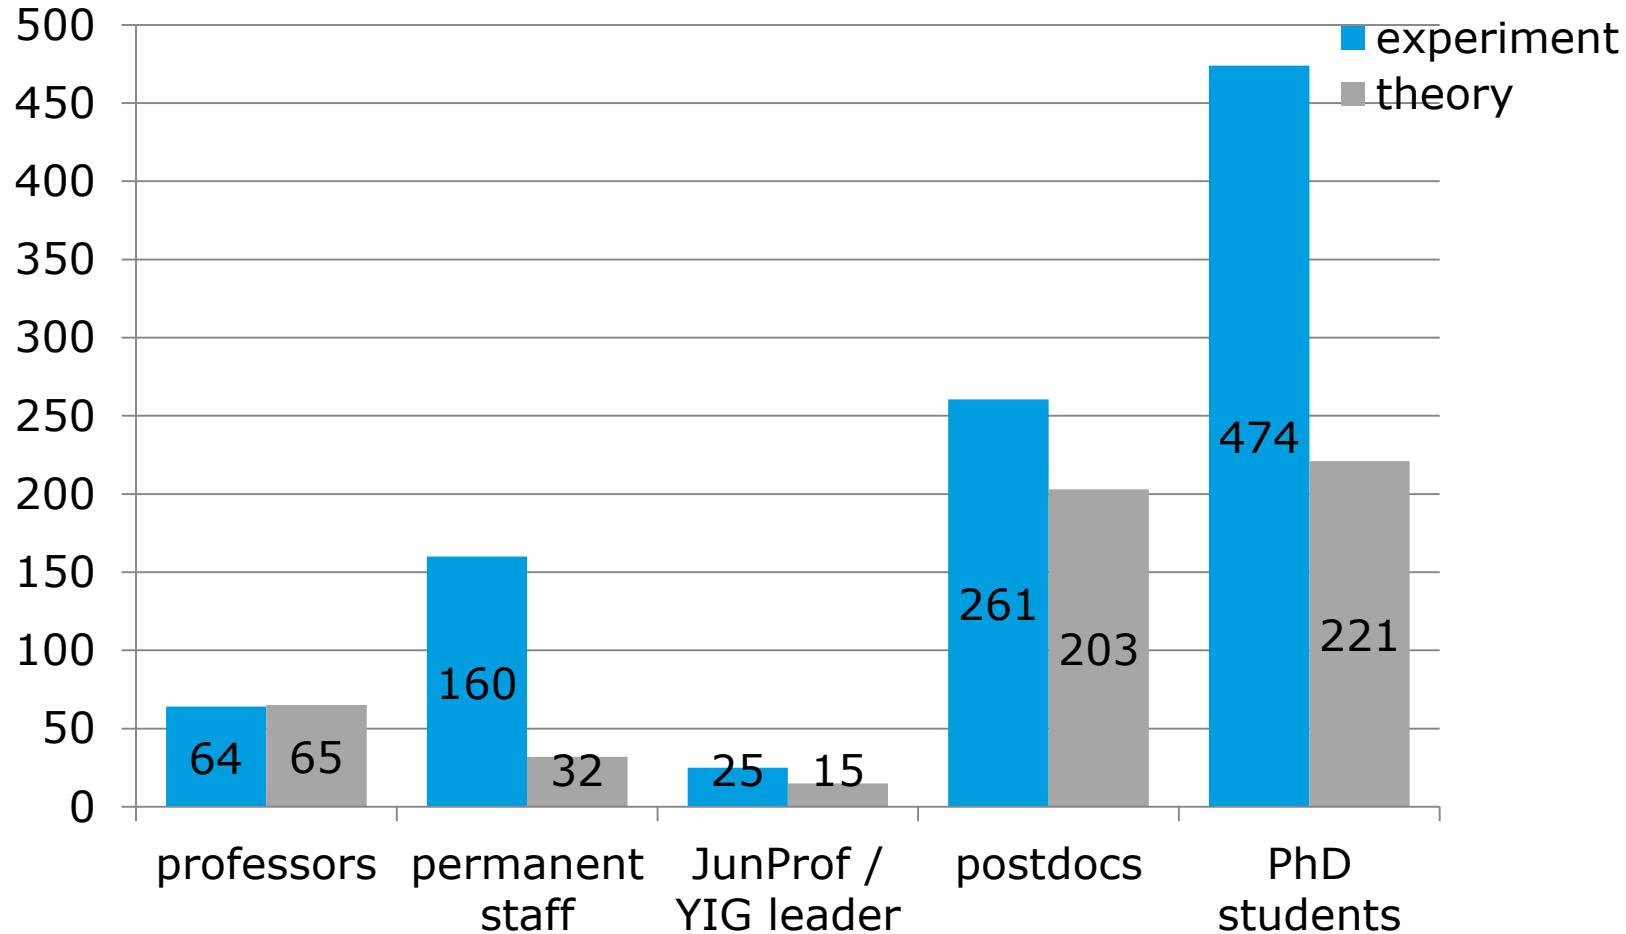

- Professors and senior staff: **65**
- Permanent (senior) scientists: **32**
- Junior-Professors and YIG-Leaders: **15**
- Postdocs and other fixed term positions: **203 FTE's**
- PhD Students: **221**

Employees in particle physics in Germany

total: 1475; total experiment: 939; total theory: 536

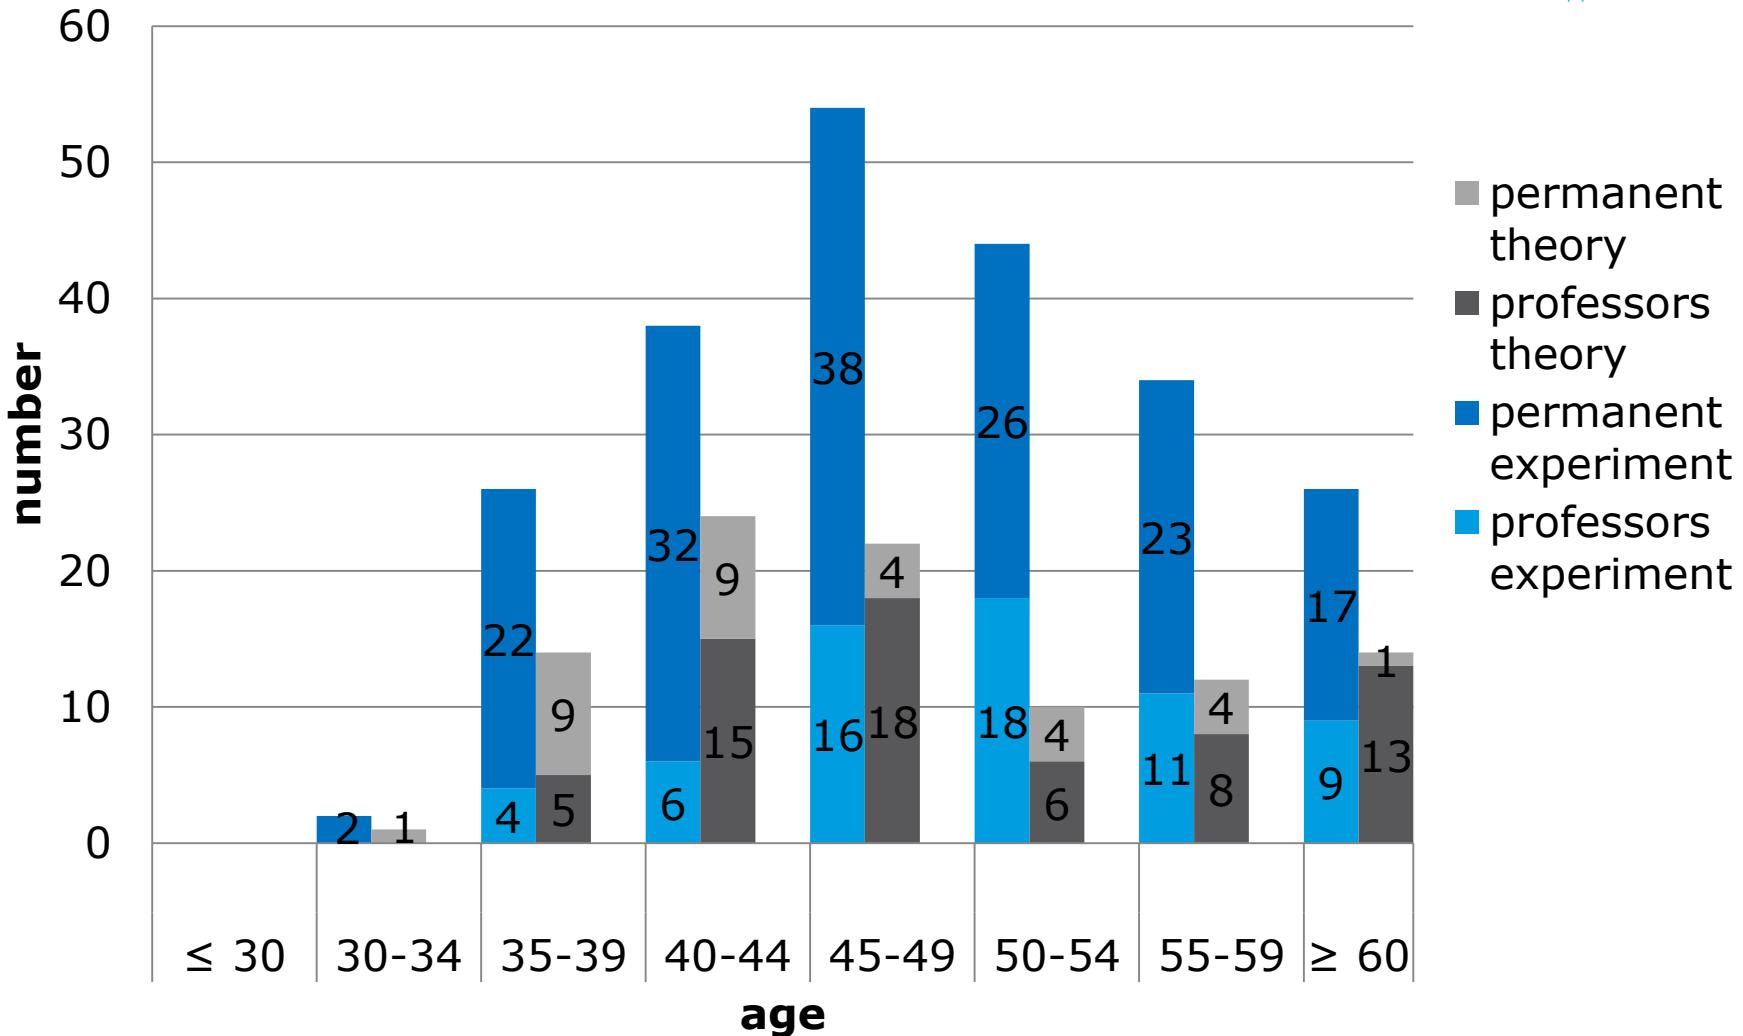

Number

Permanent employees including professors by age

total professors theory 65; total professors experiment: 64
total permanent staff theory: 32; total permanent staff experiment: 160;

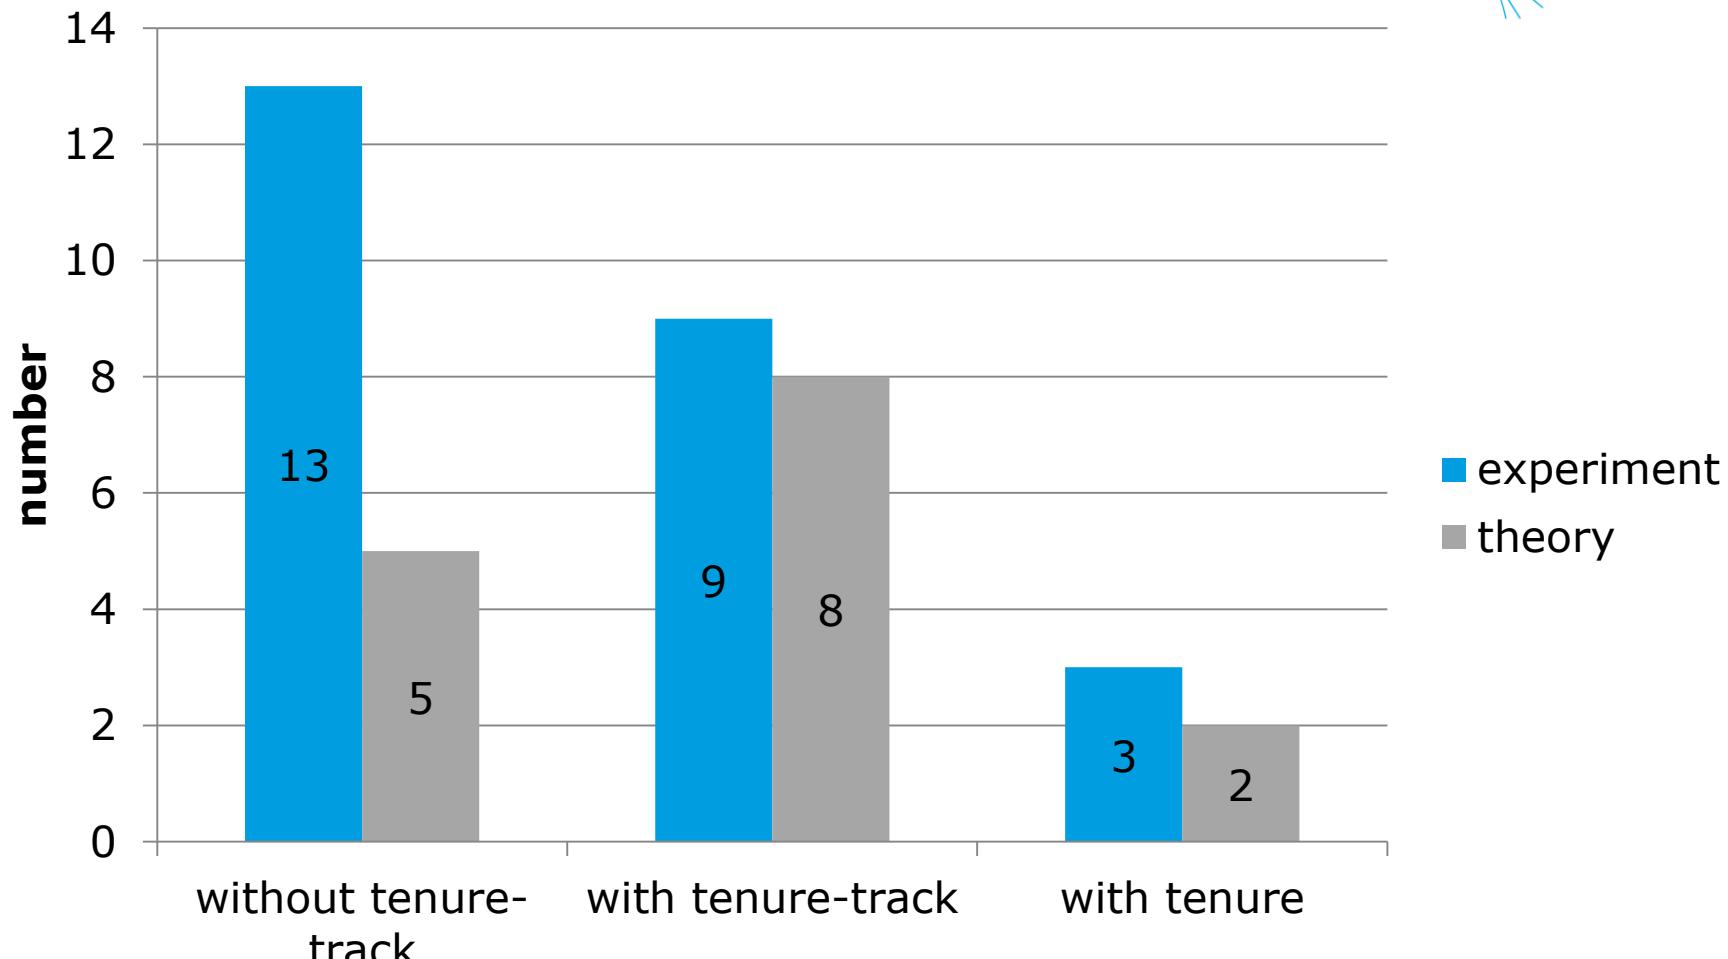

Altersstruktur in der Theorie

- Relativ niedrige Zahl an Pensionierungen in den nächsten 10-15 Jahren: ca. 2 pro Jahr
- Danach 4-5 freie permanente Theoriestellen pro Jahr zu erwarten
- Das Juniorprofessurenprogramm kann sich in der Teilchentheorie als besonders hilfreich erweisen und sollte nach Möglichkeiten ausgenutzt werden!

JunProfs & young investigator group leaders

total experiment 25; total theory 15

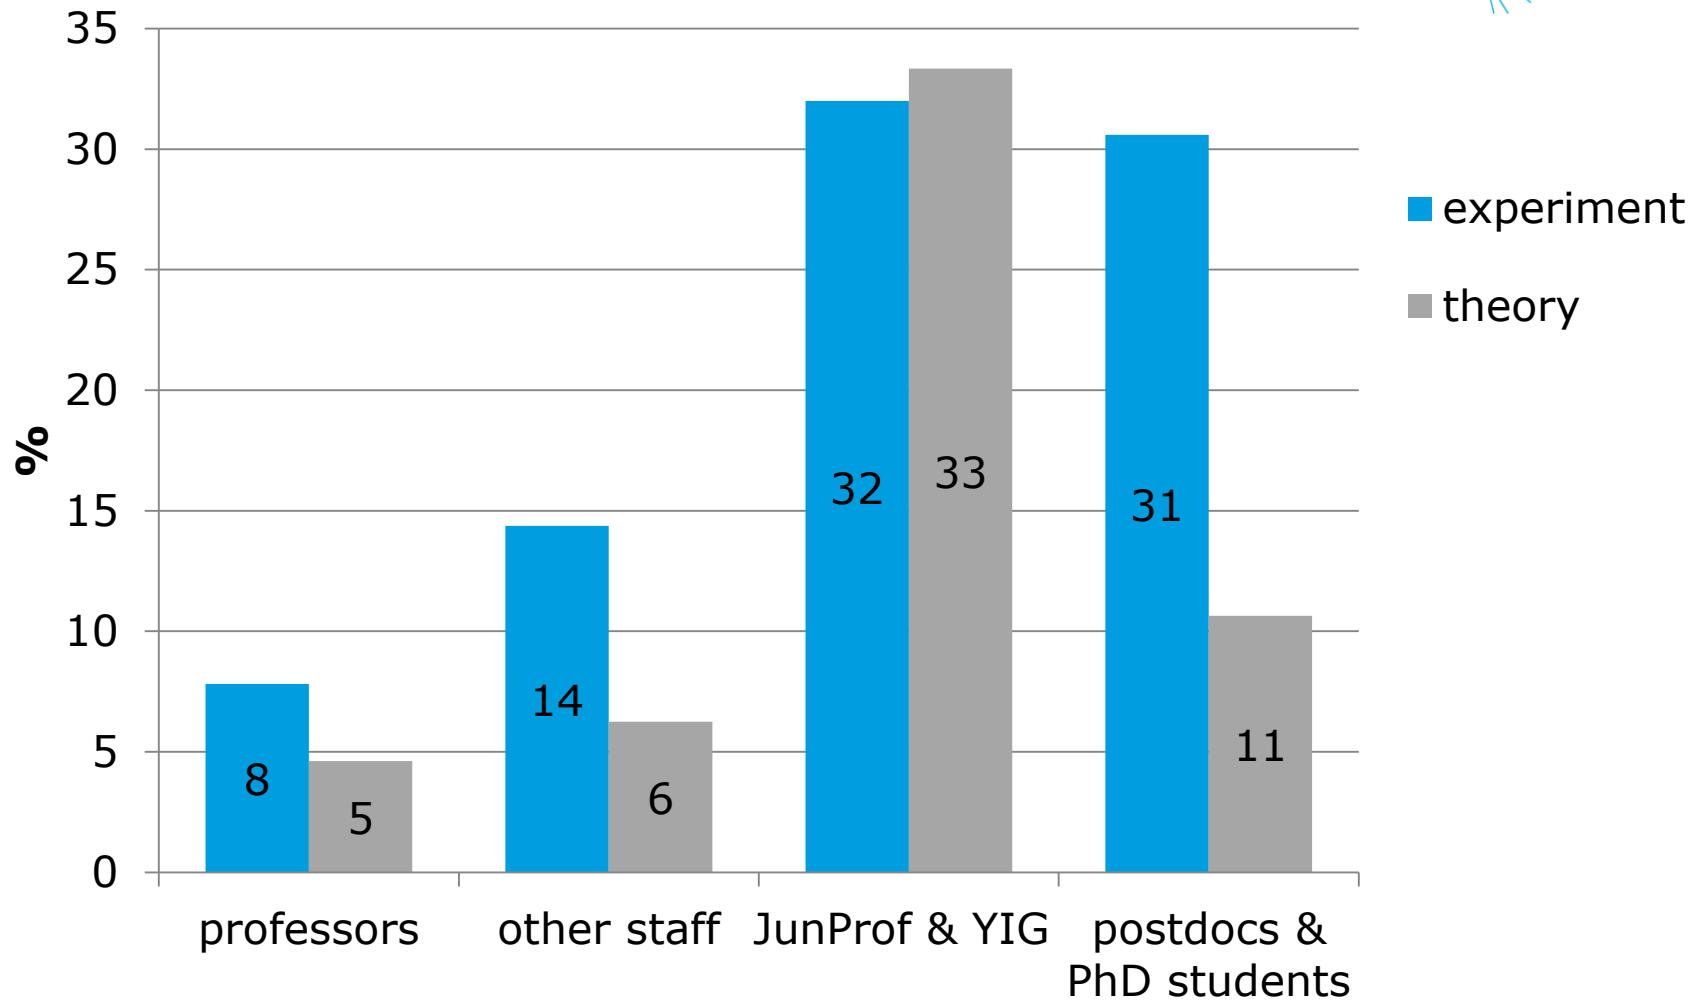

Tenure-Track ist in Teilchentheorie präferiertes Modell:

Percentage of women

total 15%; total experiment: 18%; total theory 11%

Starke Anstrengung zur Rekrutierung von Doktorandinnen weiterhin notwendig

Sonderforschungsbereiche:

- SFB/TR33 **The Dark Universe**
Heidelberg; Bonn; München 2006
- SFB/TR55 **Hadron Physics from Lattice QCD**
Regensburg; Wuppertal 2008
- SFB/TR110 **Symmetries and the Emergence of Structure in QCD**
Bonn; Beijing; Bochum; München 2012
- SFB647 **Space - Time - Matter: Analytic and Geometric Structures**
Berlin 2005
- SFB 676 **Particles, Strings, and the Early Universe**
Hamburg 2006

- Beobachtung: keine SFB's in wichtigen Kernbereichen des KET
- Problem 1: verbesserte Zusammenarbeit Theorie/Exp. in SFB durch Doppelförderungsproblematik behindert
- Problem 2: Sichtbarkeit an den Unis (SFB verleiht Prestige)

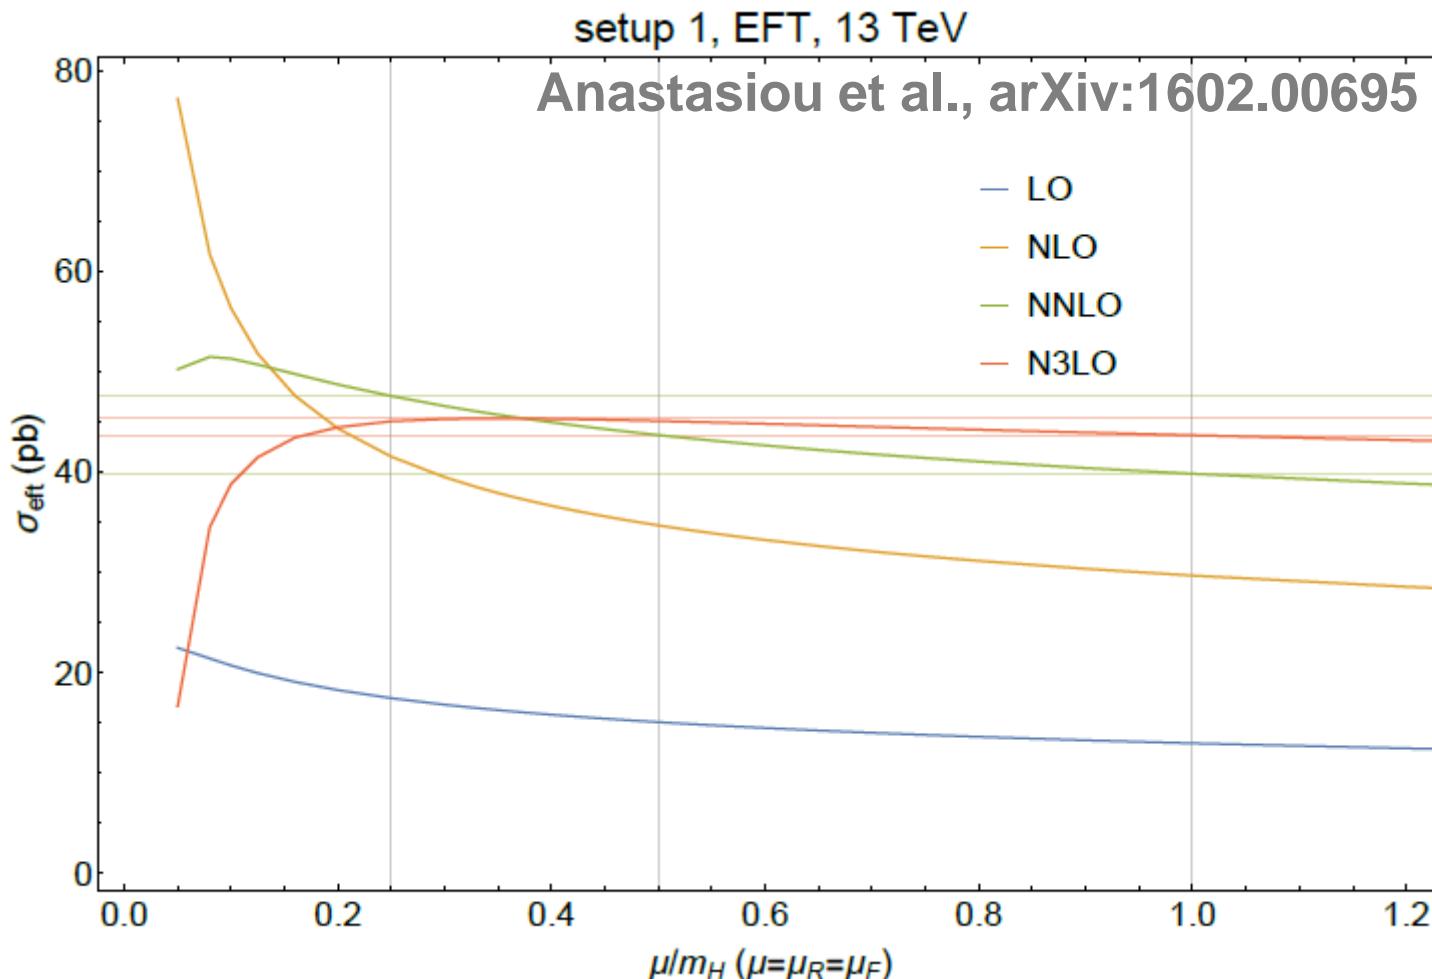

One theory highlight of 2015/16

Advances achieved by NNLO QCD corrections (and higher) are leading to a paradigm shift: precision comparison of experiment and theory at hadron colliders at the few percent level → improved sensitivity to BSM

Examples

- N3LO corrections to Higgs production
Anastasiou, Duhr, Dulat, Herzog, Mistlberger: arXiv:1503.06056
- NNLO corrections to top pair production
Czakon, Heymes, Mitov: arXiv:1511.00549
- NNLO corrections to $pT(Z)$ and to Z+jet production
Gehrman-De Ridder, Gehrman, Glover, Huss, Morgan; arXiv:1507.02850 arXiv:1605.04295

$\sigma(gg \rightarrow h)$ now known up to N3LO:

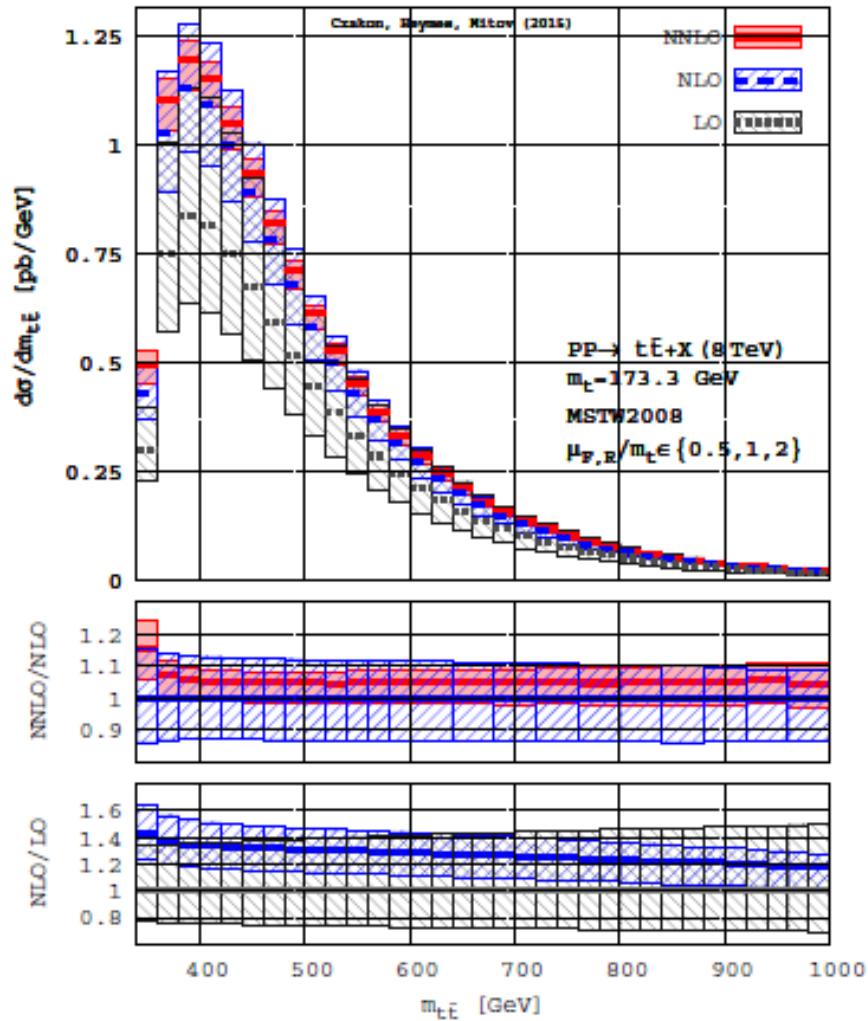

$$\sigma = 48.58 \text{ pb}^{+2.22 \text{ pb} (+4.56\%)}_{-3.27 \text{ pb} (-6.72\%)} \text{ (theory)} \pm 1.56 \text{ pb} (3.20\%) \text{ (PDF} + \alpha_s \text{)}$$

Top-pair cross section at NNLO

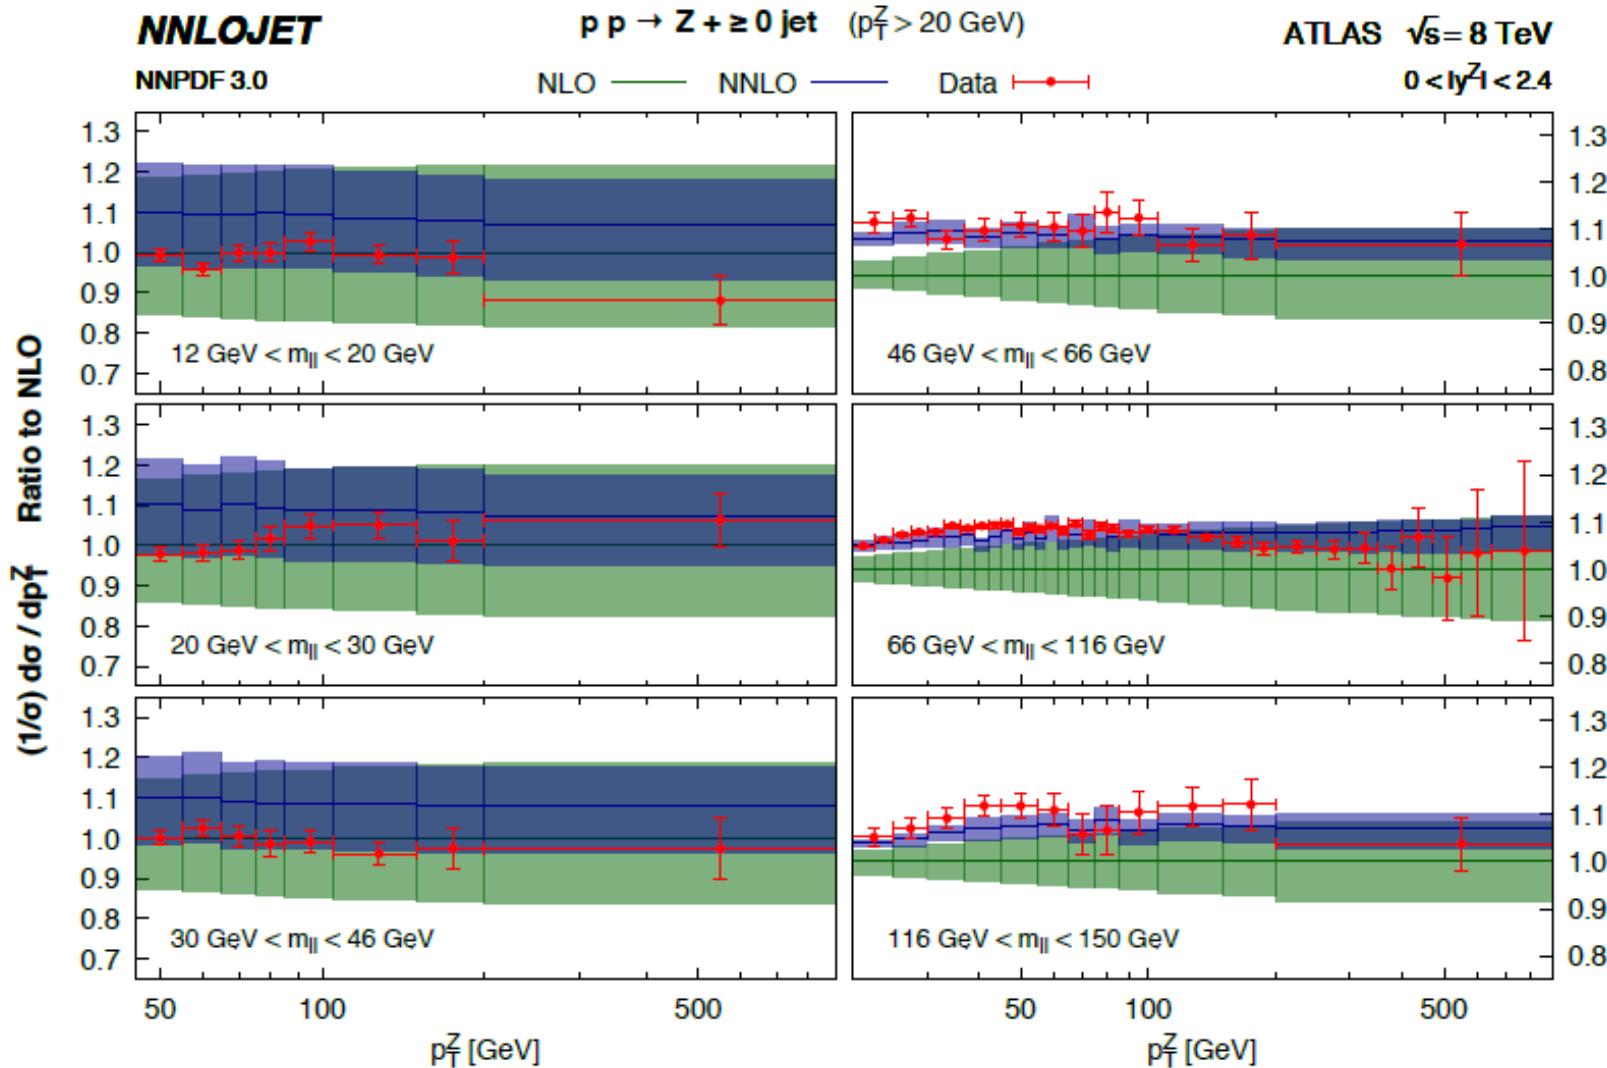

- Full Monte Carlo for stable top quarks
- Builds on earlier total cross section calculation
- Strongly reduced scale dependence
- Improves agreement with top transverse momentum measurement
- Small change in top-pair invariant mass distributions at NNLO
→ stable prediction for BSM search
- Benefits from improved gluon pdf determination, just like Higgs cross section

Czakon, Heymes, Mitov: arXiv:1511.00549

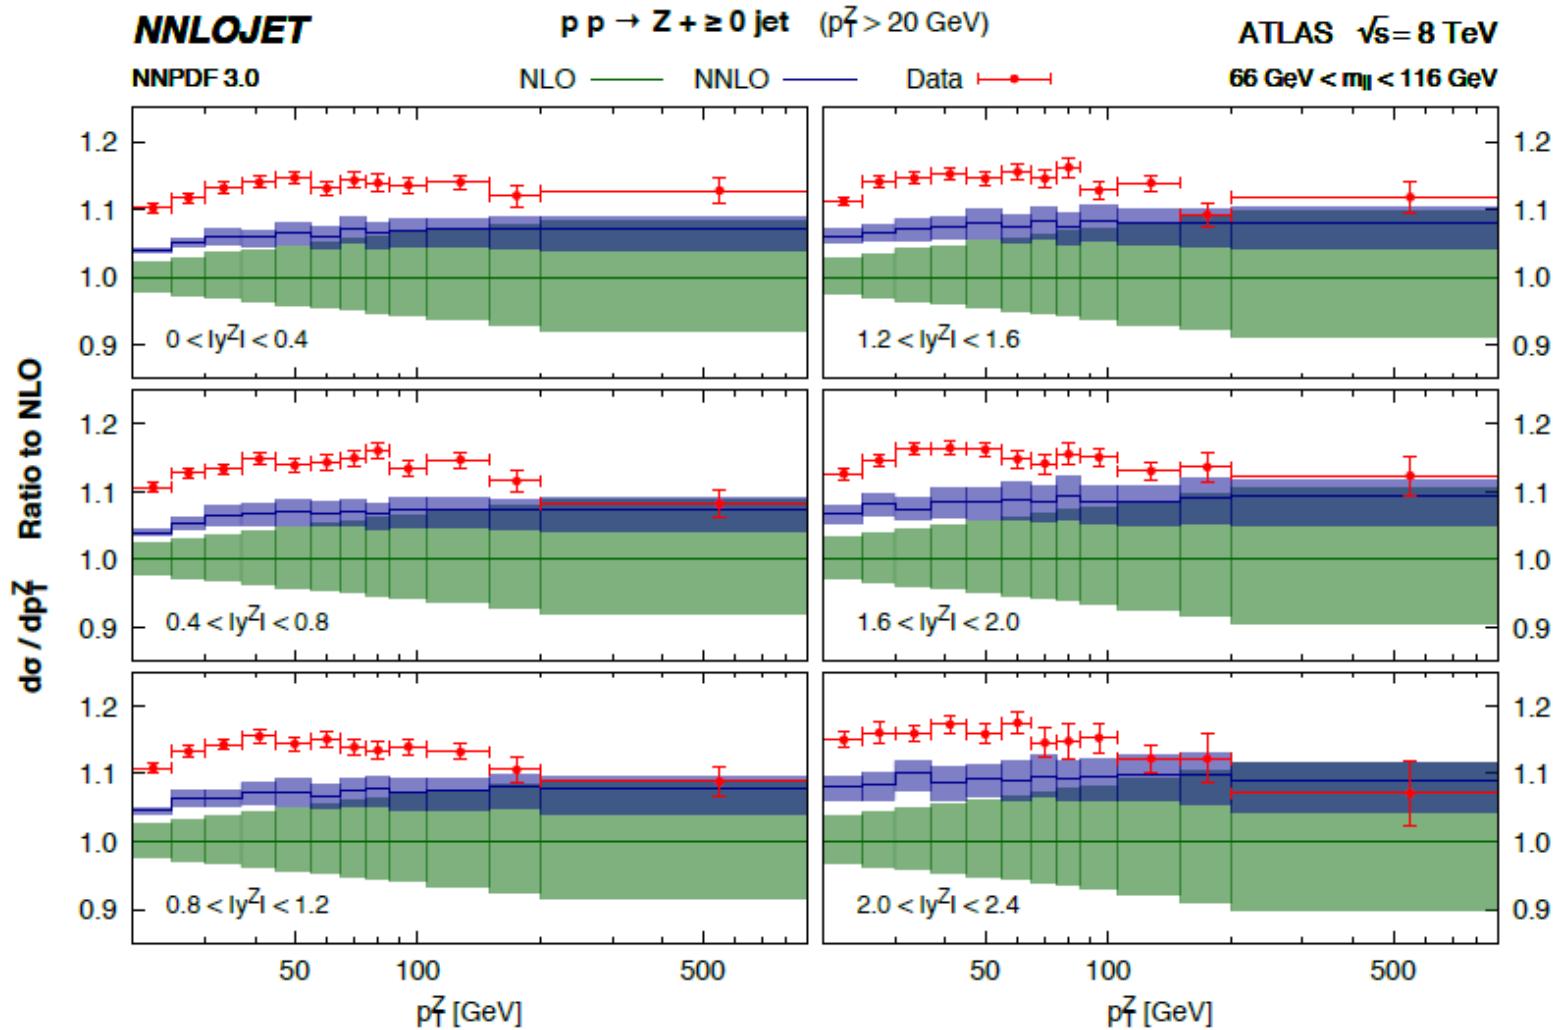

Z+jet and Z pT-distribution at NNLO

Gehrman-De Ridder et al., arXiv:1605.04295

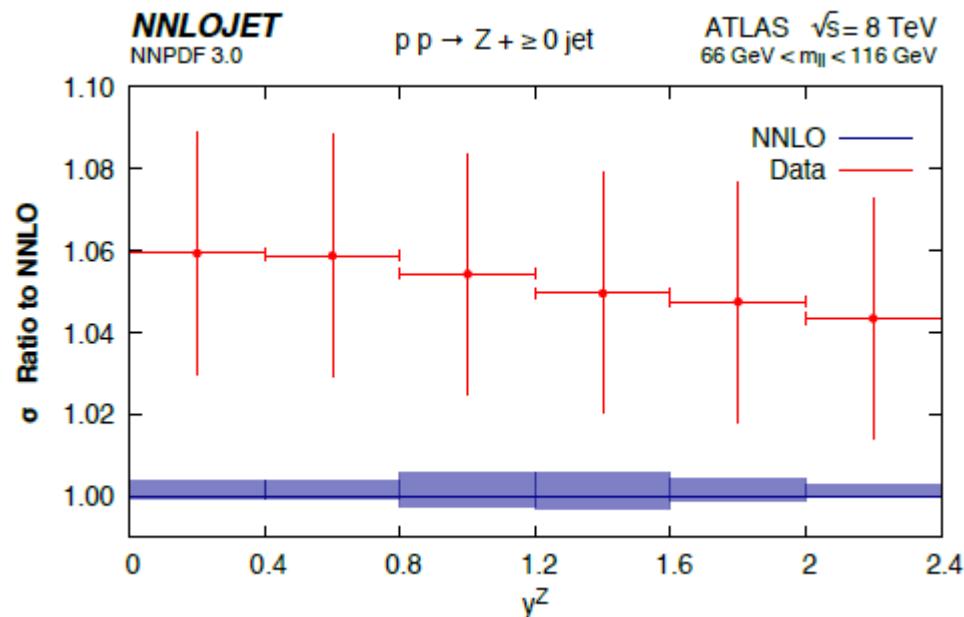

pT(Z) in rapidity bins: absolute comparison

Gehrman-De Ridder et al., arXiv:1605.04295

Normalization to fiducial Z cross sections

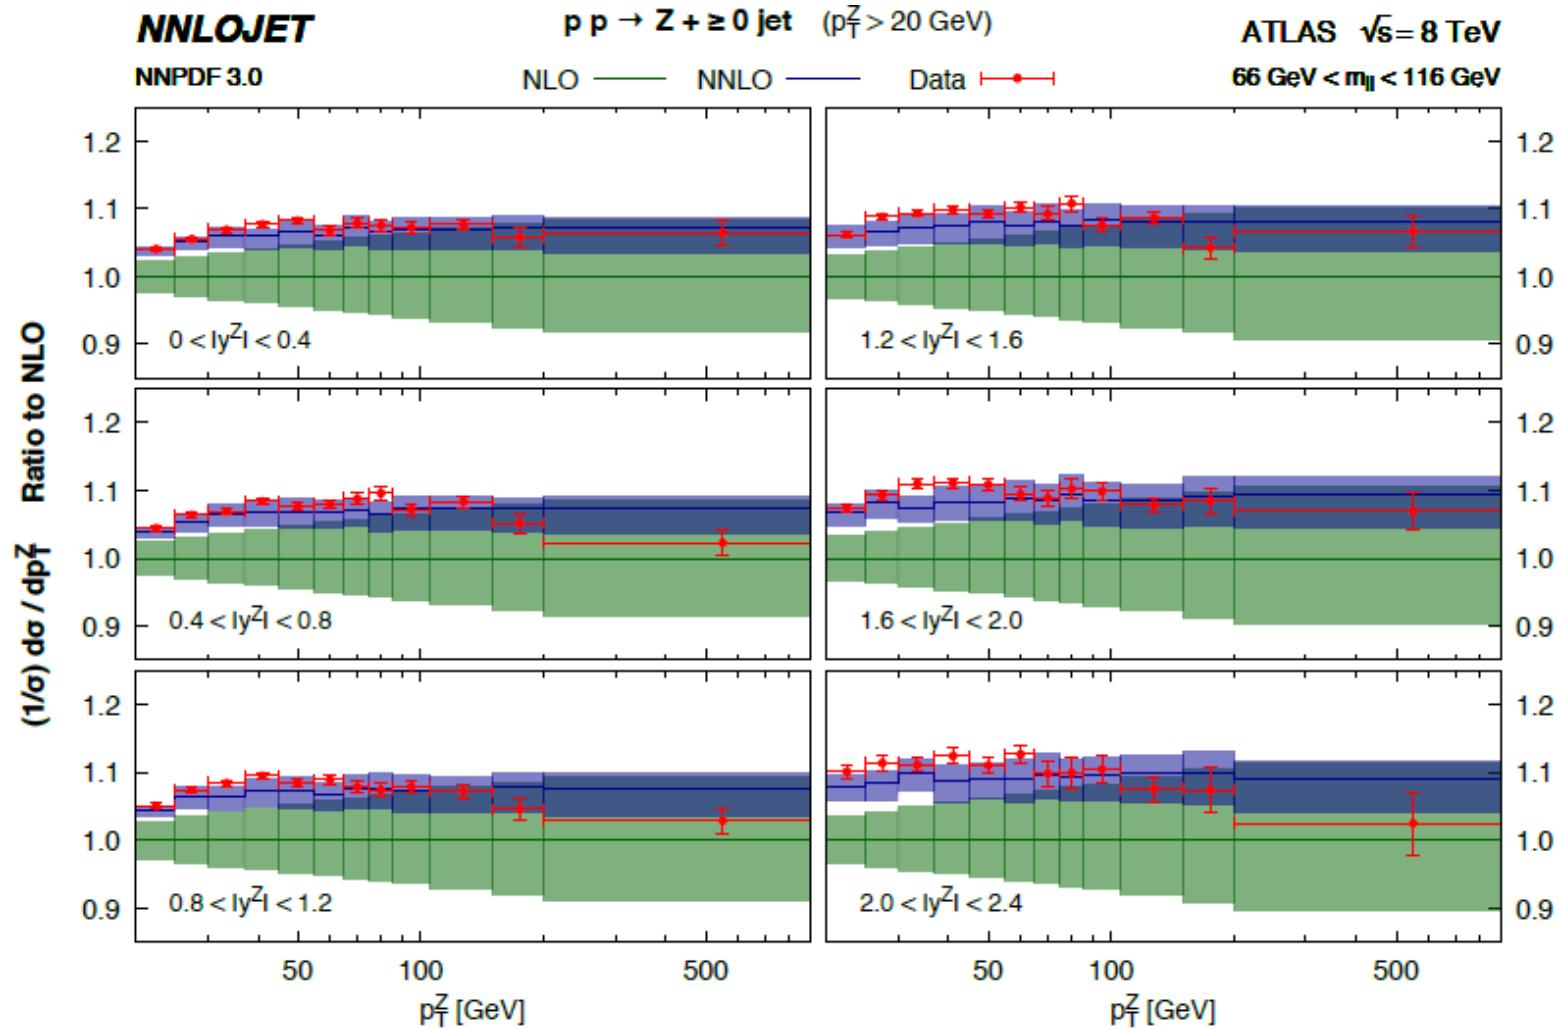

Measured total Z rate
(in rapidity bins) is
also high

Cancel common luminosity
error and partially cancel
pdf uncertainty by taking ratios

Gehrman-De Ridder et al., arXiv:1605.04295

pT(Z) in rapidity bins: normalized to fiducial cross section

Gehrman-De Ridder et al., arXiv:1605.04295

Benefits of precision Z+jets comparison

- Z+jets is dominated by quark-gluon scattering at LO
 - extract gluon distribution with NNLO precision
 - improved predictions for $gg \rightarrow H$ and top production
- Use $Z \rightarrow ll$ data and NNLO predictions to extrapolate to very high pT Z+jet events with Z decay to neutrinos
 - excellent normalization of one of the main backgrounds to monojet searches for dark matter

Zusammenfassung

- Deutschland ist bei Präzisionsrechnungen sehr stark und in die internationalen Aktivitäten eingebunden: neben NNLO (und höher) auch NLO QCD und elektroschwache Korrekturen, Monte Carlo Entwicklung etc.
- NXLO Entwicklungen sind nur kleiner Teil exzellenter Theorie in Deutschland, Europa und weltweit
- Erfolgreiche Zusammenarbeit von Theorie und Experiment in vielen Bereichen
- Zahl der neu zu besetzenden Stellen in der Theorie in den nächsten Jahren relativ niedrig, aber kann stark vom Juniorprofessurenprogramm profitieren
