

# LHCb VELO telescopes

Martin van Beuzekom  
on behalf of the LHCb VELO testbeam group  
BTTB6  
18 January 2018

- Update Timepix3 telescope
- Some performance figures
- VeloPix mini telescope

# LHCb VELO timepix3 telescope at SPS

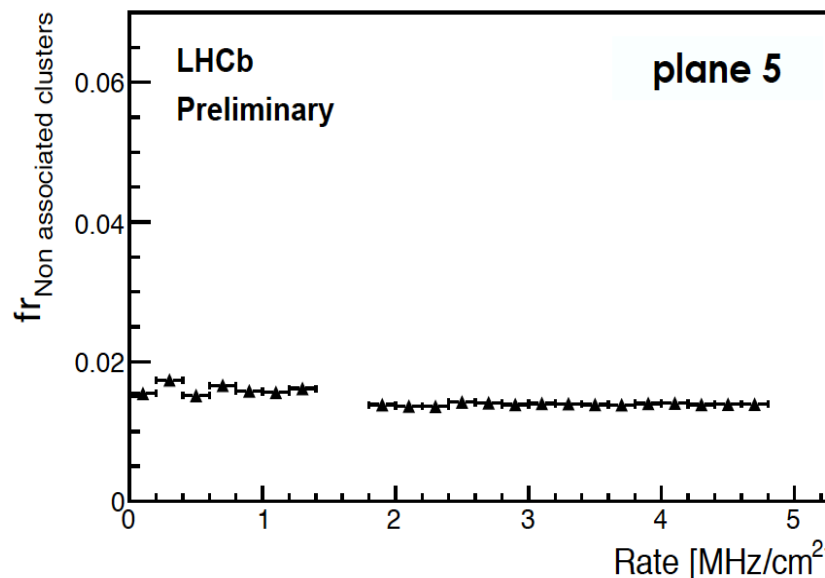

- Built for LHCb VELO upgrade sensor characterisation
- Each plane: 300  $\mu\text{m}$  Silicon on 700  $\mu\text{m}$  Timepix3, no PCB
- Simultaneous ToA and ToT measurement
- Data driven readout with SPIDR

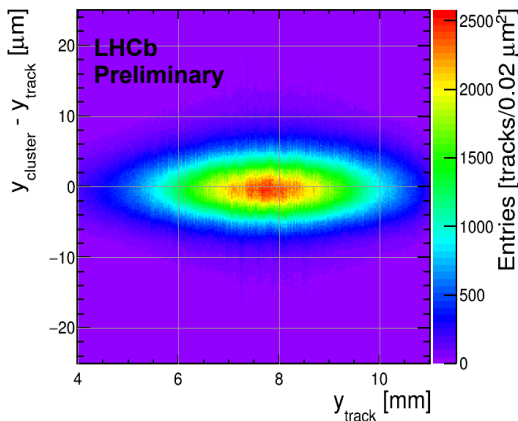

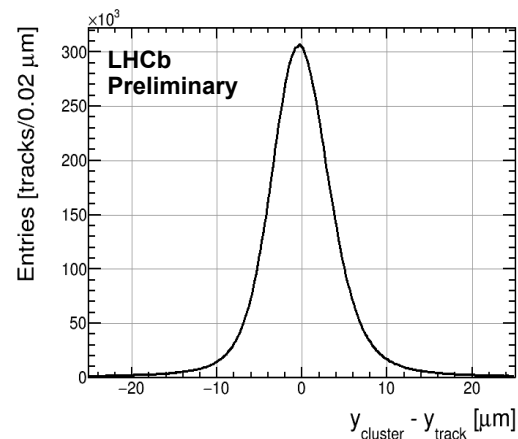

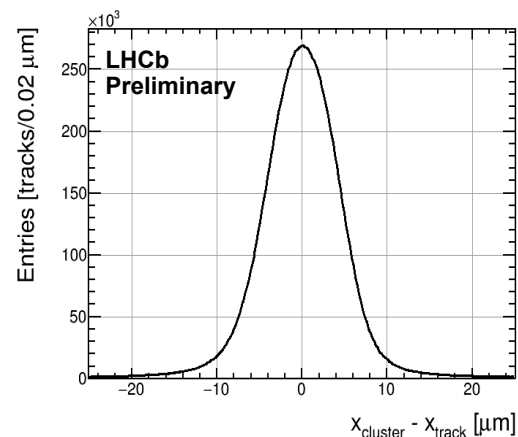

vacuum box for 1 kV  
sensors bias

# Telescope introduction II

- High tracking rate,  $\sim 10$  Mtracks/cm<sup>2</sup>/s by design
- Tested up to 5 Mtracks/cm<sup>2</sup>/s without loss of performance
- Four TDC inputs with 260 ps bins to ease integration of DUTs
- Analysis with Kepler (Gaudi based) reconstruction framework
- Telescope used by many LHCb and non-LHCb groups

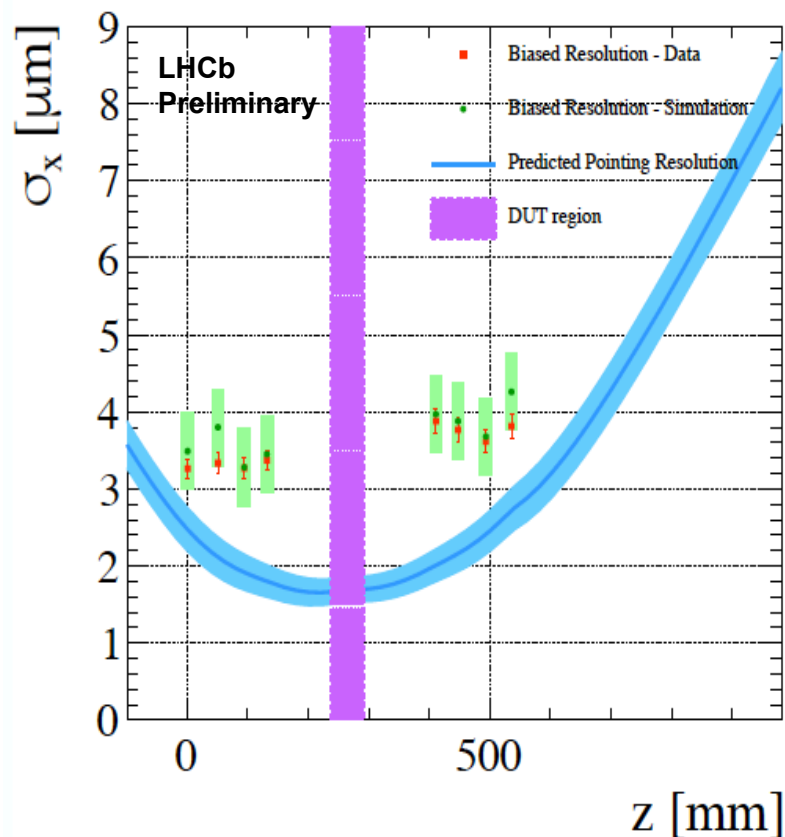

# Performance: Spatial resolution

- Pixel dimensions  $55 \times 55 \mu\text{m}^2$
- Detector planes at  $9^\circ$  angles (yaw, pitch) for optimal resolution
- (biased) Resolution  $3 - 4 \mu\text{m}$
- No significant contribution from (mis)alignment

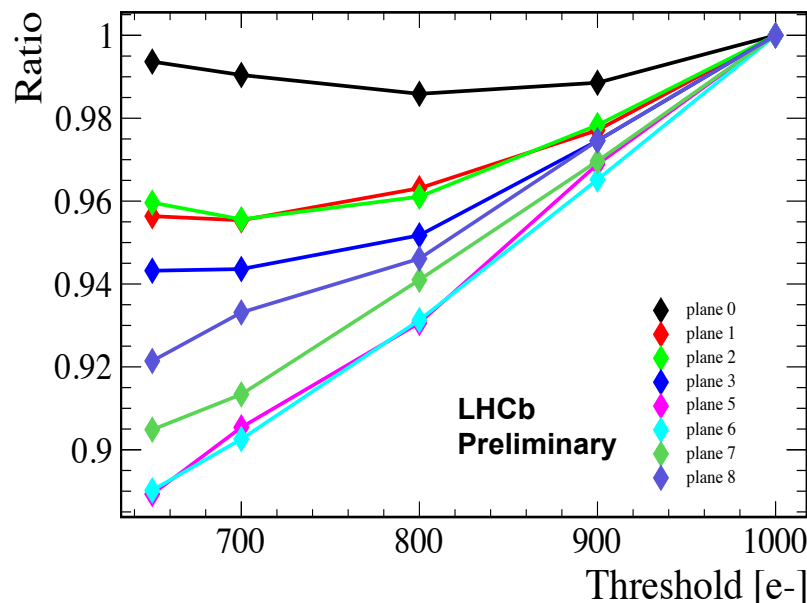

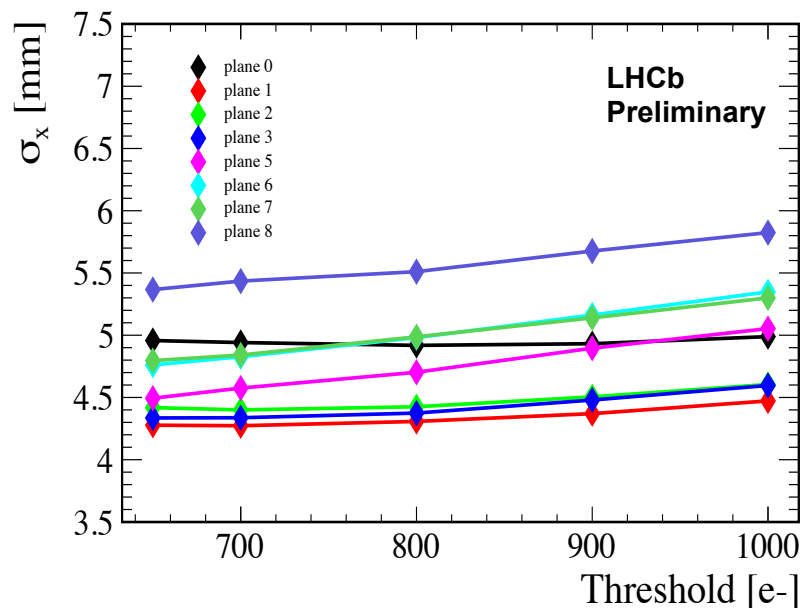

# Performance: Pointing resolution

Pointing resolution near DUT:  $x \sim 1.67 \mu\text{m}$  &  $y \sim 1.57 \mu\text{m}$

# Some improvement possible: lower threshold

- Default threshold 1000 e-
- Lower threshold gives up to 10% resolution improvement
  - due to slightly larger cluster size
- Some extra noise for very low thresholds

# Performance: Time resolution

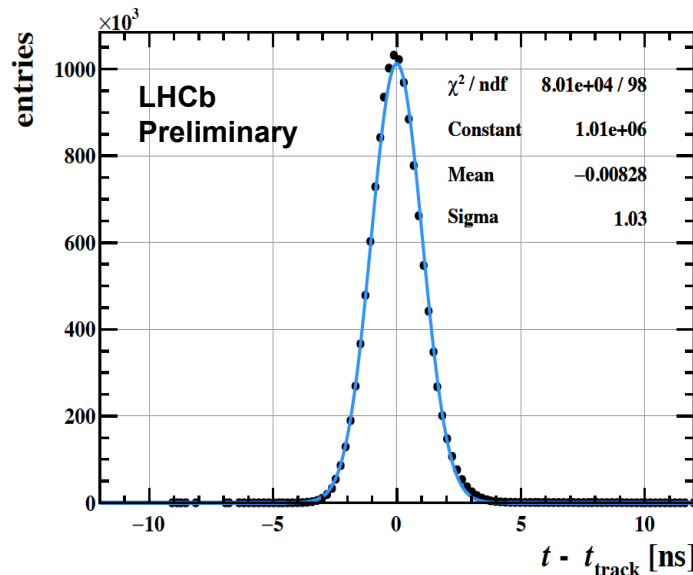

mean of biased track time residual

- Time resolution per plane  $\sigma_{\text{int}} = \sim 1$  ns
  - worse than expected ( $1.56 \text{ ns} / \sqrt{12}$ )
  - due to residual timewalk and charge collection time
- Telescope time resolution  $\sigma_{\text{tel}} = \sigma_{\text{int}} / \sqrt{8} = 0.35$  ns
  - too optimistic?, residuals might be correlated
- Dedicated study required, some data available

- Timing stable from run to run
- Offset determined per run

biased track time residual

# Resolution versus bias voltage

- Charge collection, hence timing will improve with higher bias voltage
- However, we do not want to compromise spatial resolution
- Seems that spatial resolution barely changes from 100 to 150 V bias
- Improvement on time resolution not yet determined

# VeloPix

# Reminder: LHCb VeloPix

- Derived from Timepix3, tailored to LHCb Vertex Locator
- Binary readout, radiation hard
- No trigger, read out all data, AND high luminosity -> huge data rates (20 Gbit/s/chip)
- First chip version fully functional but had some flaws -> version used in mini-telescope
- Issues solved for 2<sup>nd</sup> version of VeloPix, final qualification ongoing

# Comparison VeloPix and Timepix3

	Timepix3 (2013)	VeloPix (2016)
Pixel arrangement	256 x 256	
Pixel size	55 x 55 $\mu\text{m}^2$	
Peak hit rate	80 Mhits/s/ASIC	800 Mhits/s/ASIC 50 khits/s/pixel
Readout type	Continuous, trigger-less, <b>TOT</b>	Continuous, trigger-less, <b>binary</b>
Timing resolution/range	1.5625 ns, 18 bits	25 ns, 9 bits
Power consumption	<1.5 W	< 2 W
Radiation hardness		400 Mrad, SEU tolerant
Sensor type	e- and h+ collection	e- collection
Max. data rate	5.12 Gbps	20.48 Gbps
Technology	130 nm CMOS	

# VeloPix mini telescope

- Most VeloPix functions tested in lab and with Timepix3 telescope
- Except high rate performance

- Built a 5 layer (mini) telescope
- Reusing Timepix3 telescope HW
- Tested in High Rate area at Fermilab

# High rate test area at Fermilab (M03)

# A look at the data

- First attempt to run telescope, many last minute fixes ...
- Step wise increase of beam rate to  $> 200$  Mtracks/cm<sup>2</sup>/s
- One spill of 4.2 seconds gives about 40 Gbytes on disk
- Analysis with modified version Kepler framework
- First results look OK, but still need to analyse highest rate runs in detail

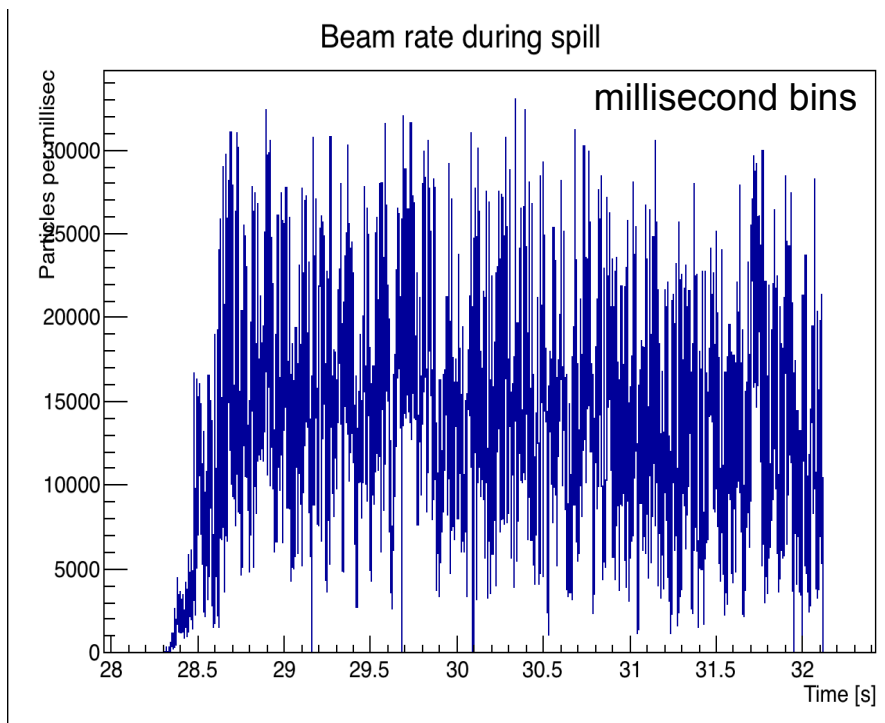

residuals  $\sim 10$   $\mu\text{m}$   
(as expected)

first VeloPix tracks!

# Beam rate

- Beam rate seems to fluctuate significantly, even at millisecond scale
- Average rates are misleading
- Some analysis challenges ahead

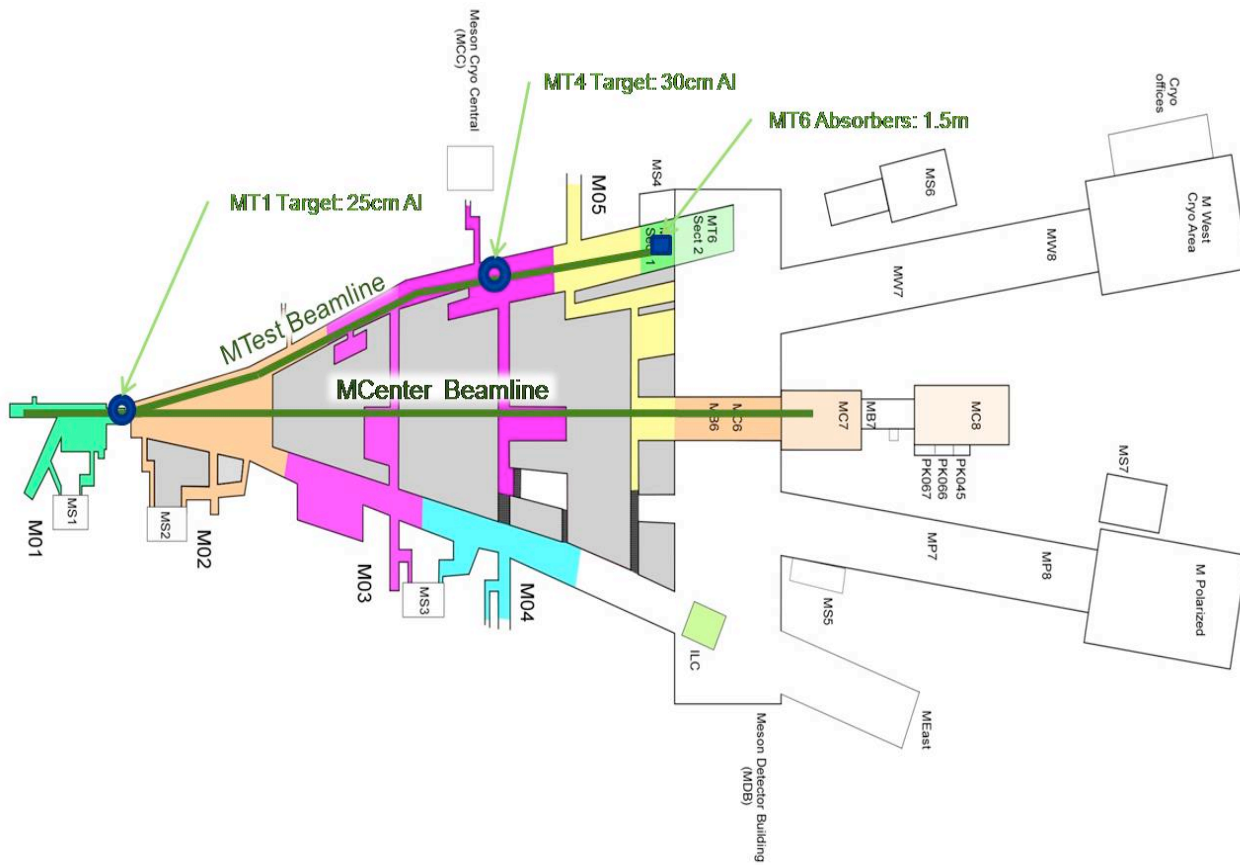

main injector cycle = 11.6 us: 7 batches, 1 filled

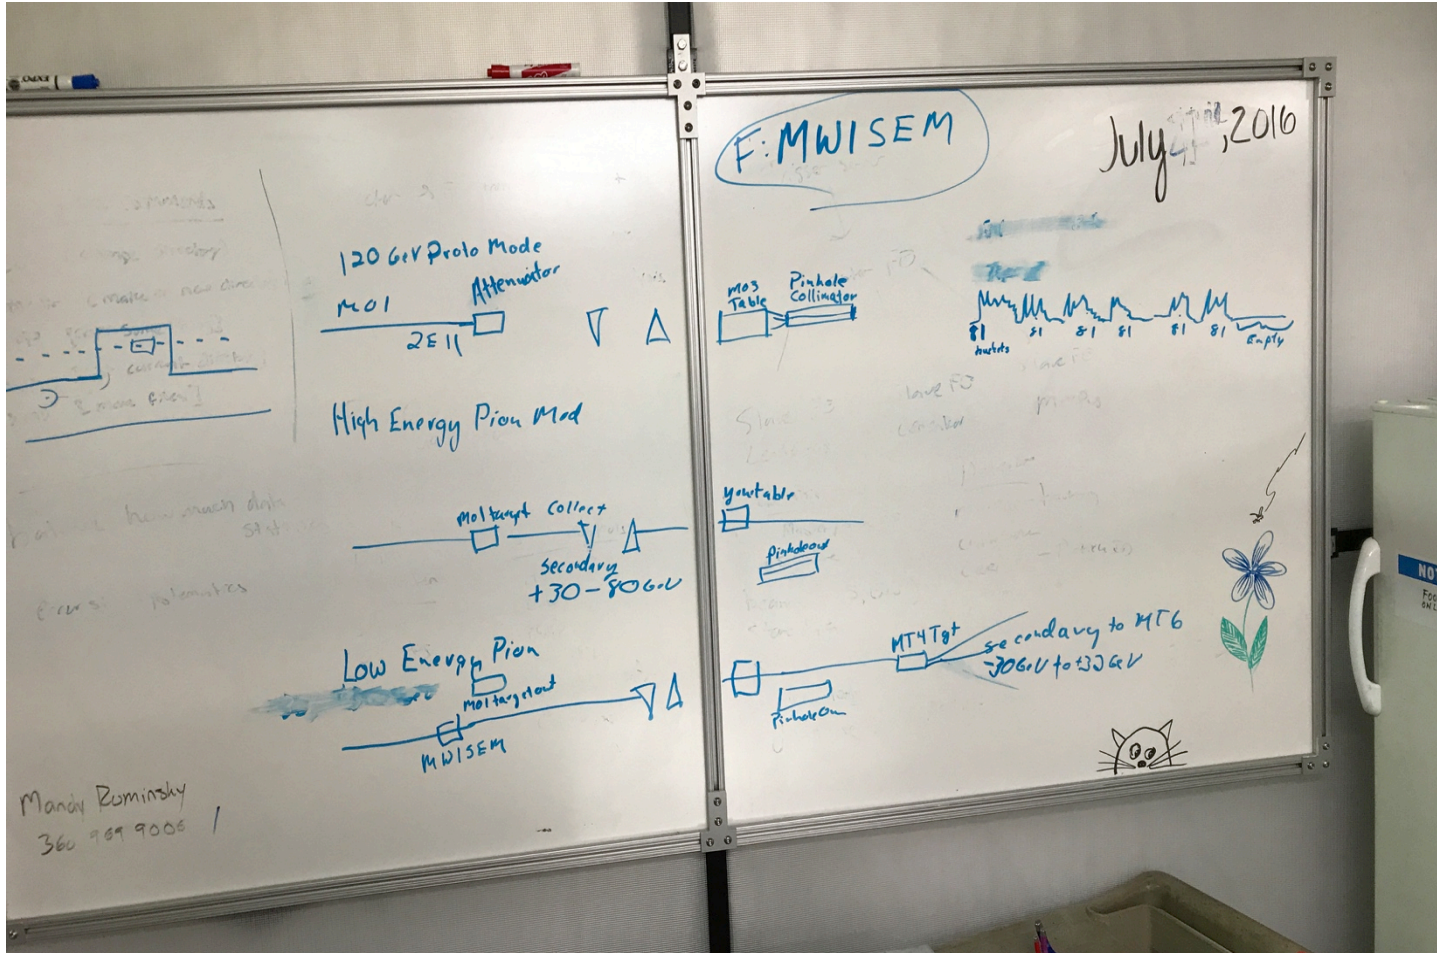

# Summary

- LHCb Timepix3 telescope operated successfully > 3 years
  - Workhorse for LHCb VELO upgrade program
  - Also frequently used by other LHCb and non-LHCb groups
- Spatial resolution < 2  $\mu\text{m}$ , time resolution < 1 ns, track rate > 5 Mtracks/cm<sup>2</sup>/s
  - Minor improvements possible
- Built VeloPix mini-telescope to test VeloPix at high-rate at FNAL
  - Interesting and challenging 'exercise'
- Successfully acquired data with rates > 200 Mtracks/cm<sup>2</sup>/s
- Results so far as expected; high rate data to be analysed in greater detail
  - Still on the agenda: timewalk measurement of VeloPix with Timepix3 telescope

# Back up

# Timepix3 telescope networking
