

# p-wave annihilating DM and the EDGES 21-cm Signal

Gregory Ridgway

Hongwan Liu and GR, in preparation

---

# p-wave Annihilation

---

- ❖ Working definition:  $\langle \sigma v \rangle \propto v^2$
- ❖ Fairly common amongst DM models
- ❖ One of the models used to explain the EDGES signal
- ❖ Sensitive to late-time constraints, i.e. a natural target for 21-cm measurements

# The Global 21-cm Signal

## Important points:

- Sky-averaged signal (i.e. Global signal)
- **Redshift information** contained in 
- $\Delta T_{21}$  depends on radiation temperature,  $T_R$ , and visible matter temperature,  $T_m$ .

Structure Formation Drives  
p-wave Constraints

## Temperature History

Preliminary

How sensitive is a 21-cm constraint  
compared to other constraints?

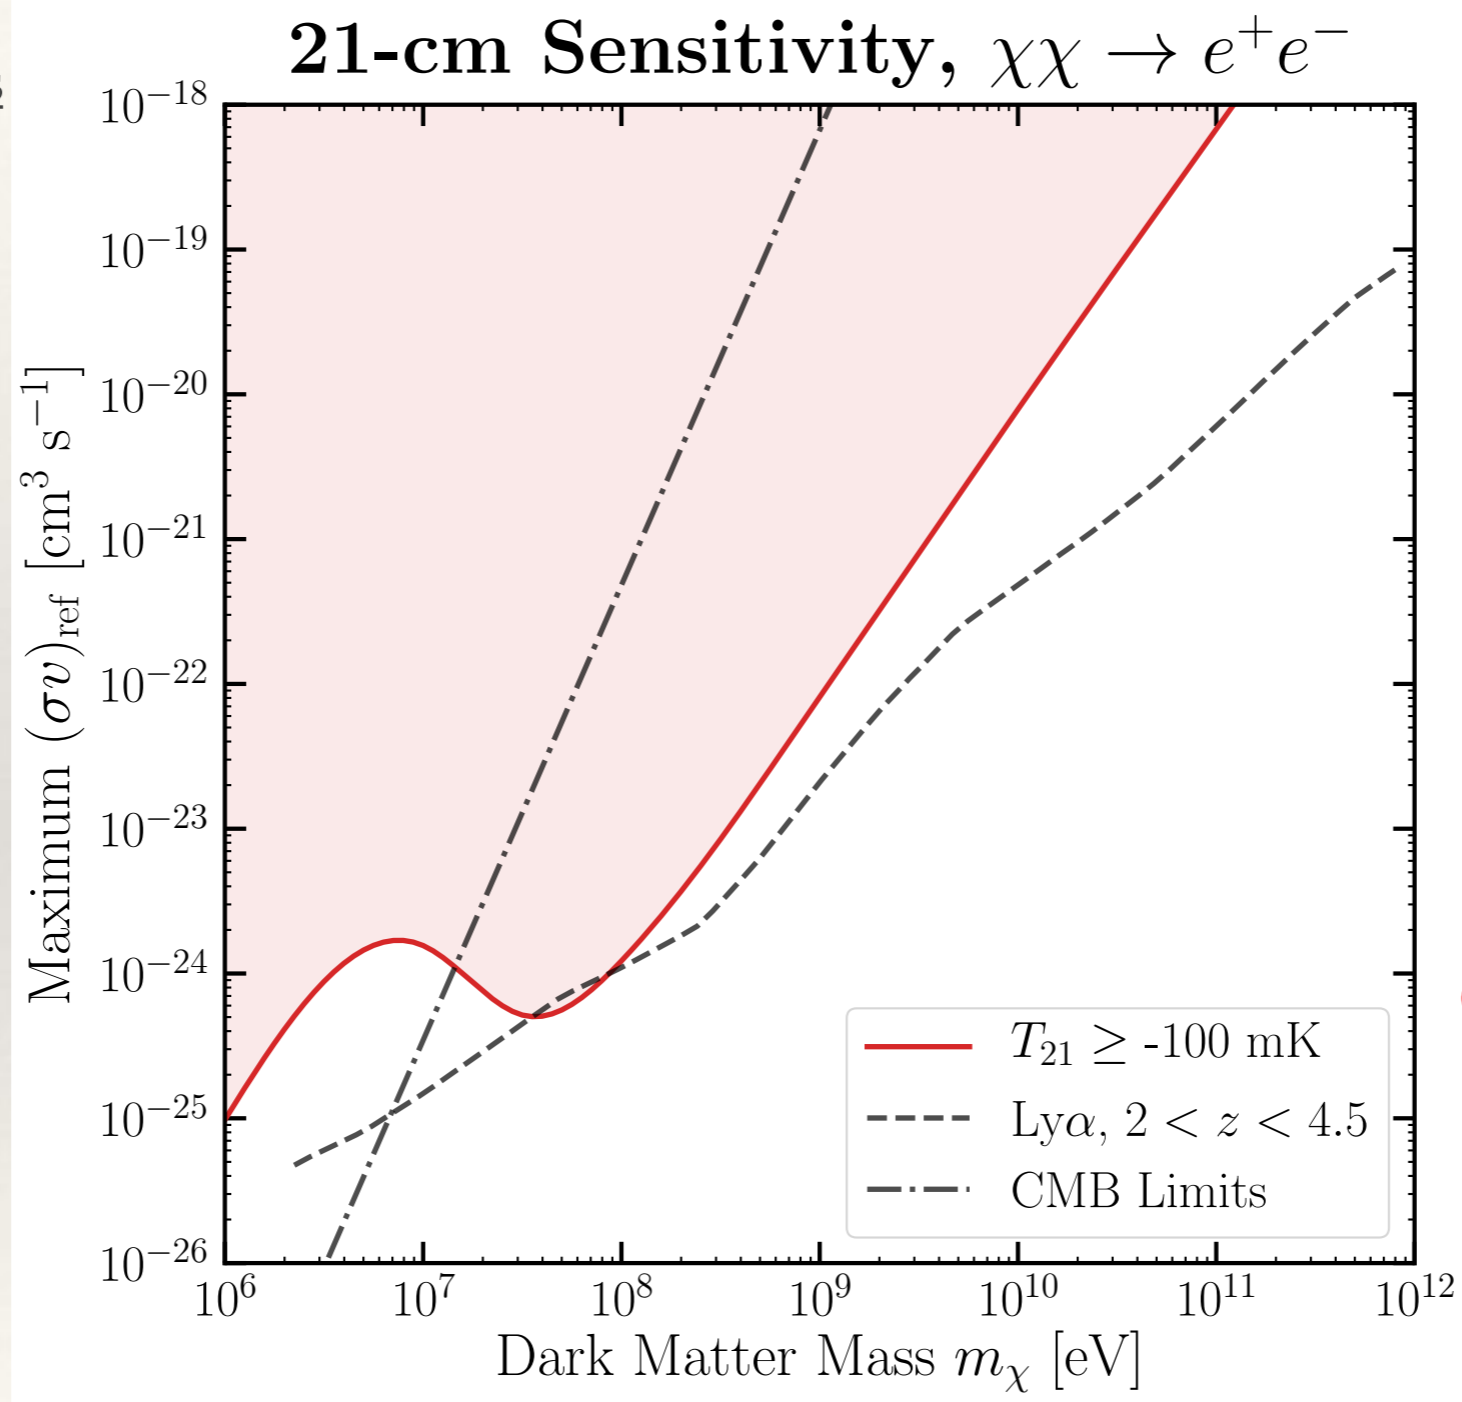

# 21-cm Sensitivity

## Standard Assumptions

$$T_R = T_{\text{CMB}}$$

$$\Delta T_{21} \approx -100 \text{ mK}$$

(Ignore EDGES)

Preliminary

# 21-cm Sensitivity

## Standard Assumptions

$$T_R = T_{\text{CMB}}$$

$$\Delta T_{21} \approx -100 \text{ mK}$$

(Ignore EDGES)

Complementary constraints probing different eras

**Preliminary**

How can we use the EDGES result?

# The EDGES signal

Bowman et. al: Nature 555, 67 (2018)

# The EDGES signal

Bowman et. al: Nature 555, 67 (2018)

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

at 99% CL

# The EDGES signal

Bowman et. al: Nature 555, 67 (2018)

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

Cannot be satisfied by

$$T_R = T_{CMB}$$

and

standard  $T_m$

# The EDGES signal

So either make

❖  $T_R$  hotter

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

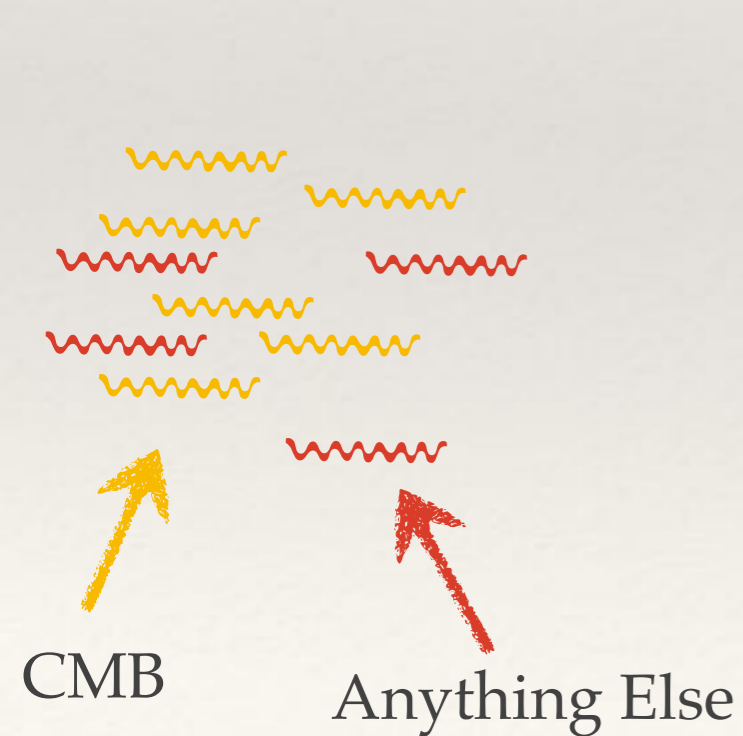

# The EDGES signal

So either make

❖  $T_R$  **hotter**

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

1. There was an additional source(s) of 21cm radiation

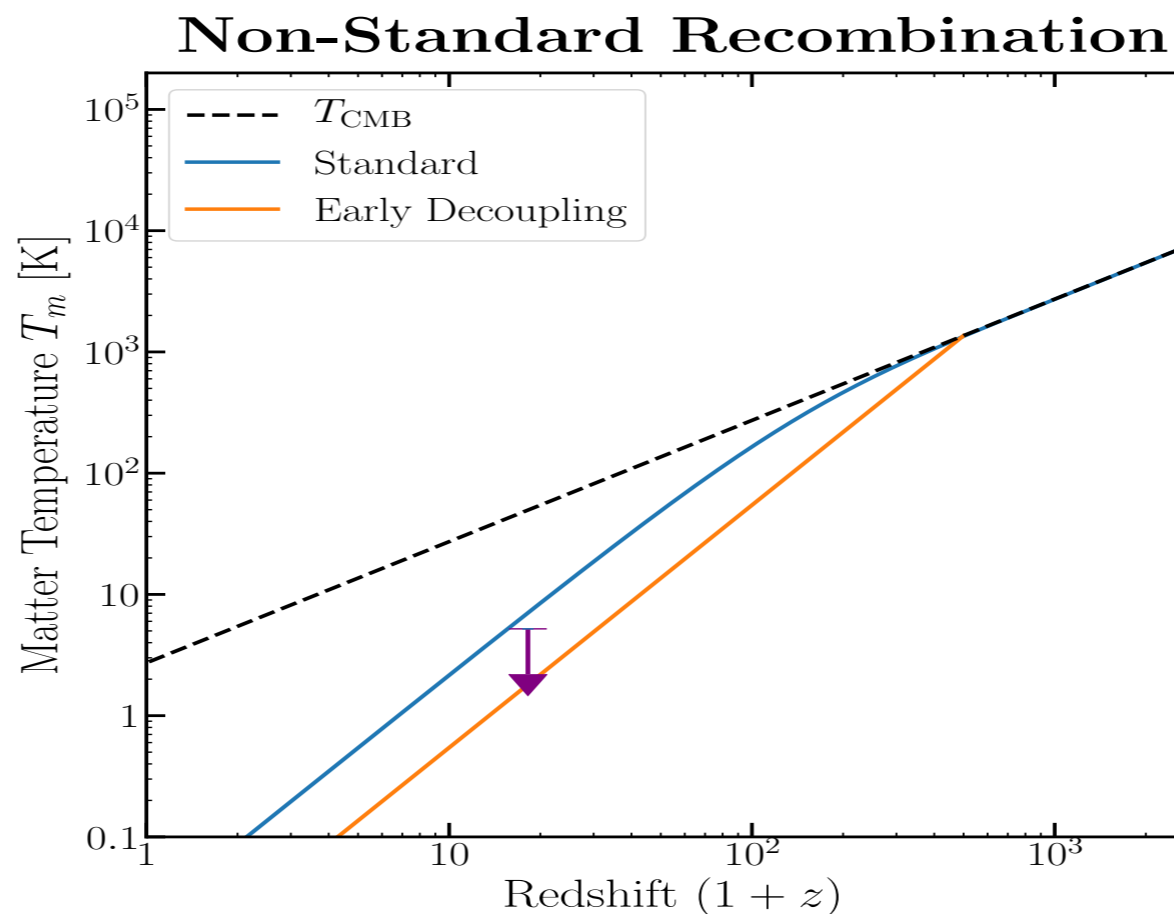

# The EDGES signal

So either make

- ❖  $T_R$  **hotter** or
- ❖  $T_m$  **colder**

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

1. There was an additional source(s) of 21cm radiation
2.  $T_m$  decoupled from  $T_{CMB}$  earlier than is typically assumed

# The EDGES signal

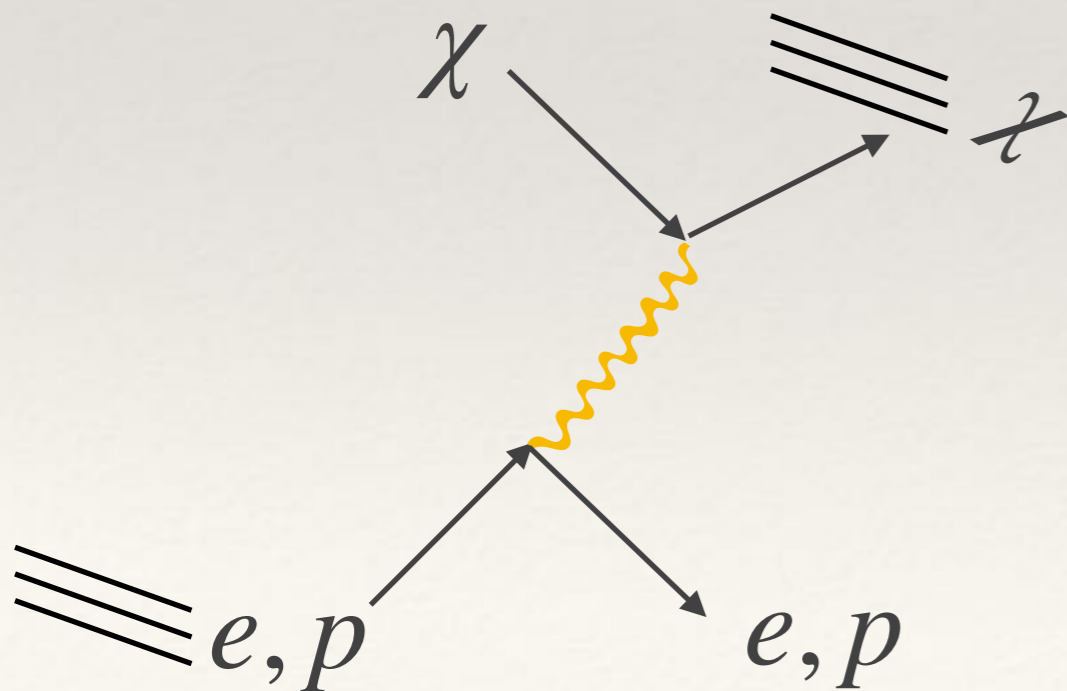

So either make

- ❖  $T_R$  hotter
- ❖  $T_m$  colder

$$\frac{T_m}{T_R}(z = 17.2) \leq 0.105$$

1. There was an additional source(s) of 21cm radiation
2.  $T_m$  decoupled from  $T_{CMB}$  earlier than is typically assumed
3. There is a DM component that cools  $T_m$  through its interactions

Focus for remainder of talk

---

# Recap

---

- ❖ The **21-cm signal** is a powerful tool for studying DM models, particularly p-wave annihilating models. It puts an upper bound on  $T_m$  at  $z \sim 17.2$ .
- ❖ **Structure formation** is an essential ingredient in p-wave analyses
- ❖ The EDGES signal forces us to consider exotic temperature histories or sources of 21-cm radiation.
- ❖ The **non-zero thermal velocity** in the **milli-charged scalar model** is an important constraint of that model.

Thank You
