

Dark Matter searches with the MAGIC telescopes

Monday 27 August 2018 14:00 (20 minutes)

Indirect searches for dark matter with the ground-based MAGIC telescopes will be reviewed. Different targets with a large expected dark matter content, such as galaxy clusters and dwarf satellite galaxies, allow to constrain dark-matter annihilation/decay processes up to the TeV mass scale. Latest results from deep observations of the galaxy cluster Perseus and the dwarf spheroidal Ursa Major II will be presented.

Primary author: Dr VAZQUEZ ACOSTA, Monica (Instituto de Astrofísica de Canarias)

Co-authors: Mrs MAGGIO, Camilla (UAB); Mr NINCI, Daniele (IFAE); Dr RICO, Javier (IFAE); Dr PALACIO, Joaquim (IFAE); Dr GAUG, Markus (UAB); Dr DORO, Michele (Padova); Dr GIAMMARIA, Paola (Rome, INAF); Dr LOMBARDI, Saverio (Rome, INAF)

Presenter: Dr VAZQUEZ ACOSTA, Monica (Instituto de Astrofísica de Canarias)

Session Classification: Dark Matter

Track Classification: Dark Matter
