

New measurements with high-energy neutrinos in IceCube

The IceCube Neutrino Observatory, a cubic-kilometer in-ice detector at the South Pole, offers a unique window into the smallest and largest scales of our universe. In this poster, I will present several new physics analyses with seven years of data using the high-energy starting event selection. This includes a Standard Model cross-section measurement that exploits the flux attenuation of high-energy neutrinos as they pass through the Earth, constraints on dark matter scattering, annihilation and decay, and new-physics constraints Beyond the Standard Model.

Session and Location

Wednesday Session, Poster Wall #173 (Ballroom)

Poster included in proceedings:

yes

Primary author: Dr YUAN, Tianlu (University of Wisconsin Madison)

Co-authors: Mr SCHNEIDER, Austin (University of Wisconsin Madison); Dr ARGUELLES, Carlos (MIT); Mr DUJMOVIC, Hrvoje (Sungkyunkwan University); Ms STACHURSKA, Juliana (DESY); Dr RICHMAN, Mike (Drexel University); Dr WANDKOWSKY, Nancy (University of Wisconsin Madison); Mr MANDALIA, Shivesh (Queen Mary University of London); Dr KATORI, Teppei (Queen Mary University of London)

Presenter: Dr YUAN, Tianlu (University of Wisconsin Madison)

Track Classification: Poster (participating in poster prize competition)
