J. Herrero-García, E. Molinaro, MS [1803.05660]

Gravitational evidence for dark matter

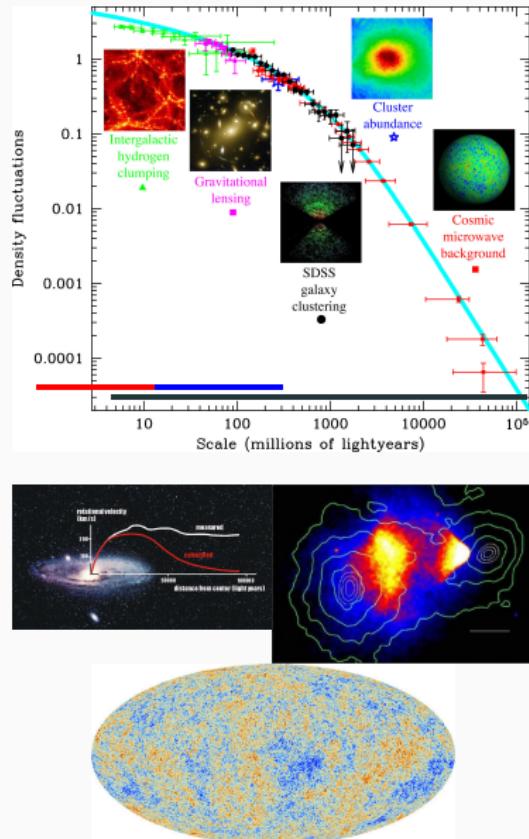

Evidences across all astrophysical scales

- Galaxy rotational curve
- Bullet cluster with grav. lensing
- Cosmic microwave background

- fit with Λ CDM
- dark matter abundance:

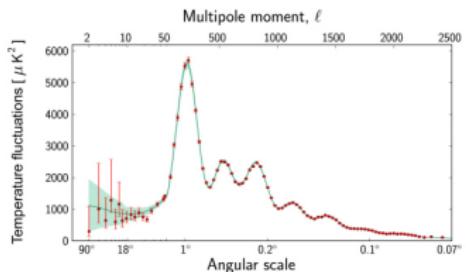

$$\Omega_{\text{CDM}} h^2 = 0.12$$

Gravitational evidence for dark matter

Evidences across all astrophysical scales

- Galaxy rotational curve
- Bullet cluster with grav. lensing
- Cosmic microwave background

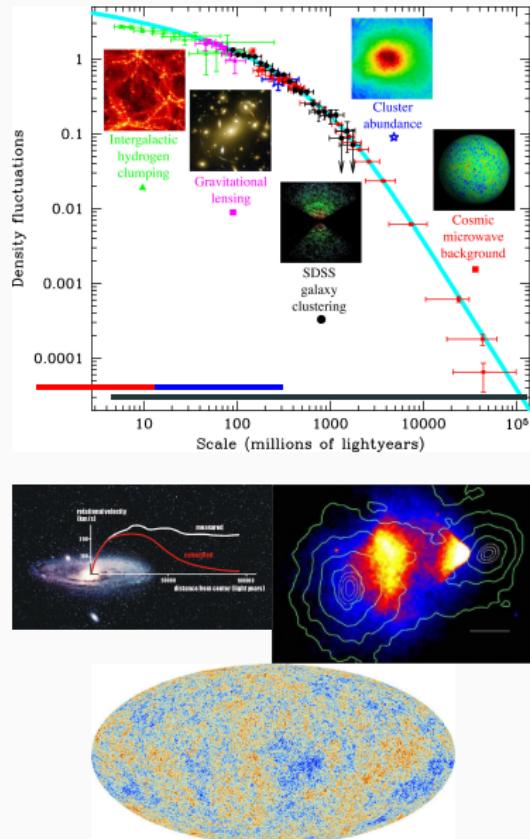

- fit with Λ CDM
- dark matter abundance:

$$\Omega_{\text{CDM}} h^2 = 0.12$$

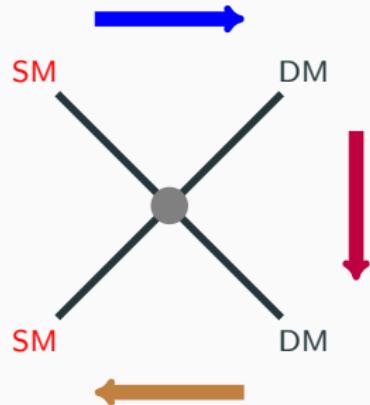

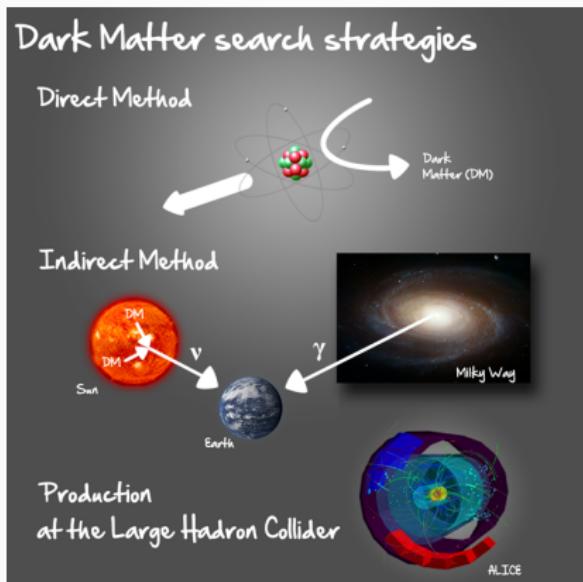

Popular candidate:

Weakly Interacting Massive Particles

No other clear signal in dark matter searches

- ? dark matter mass
- ? spin and other quan. numbers
- ? interactions and strength

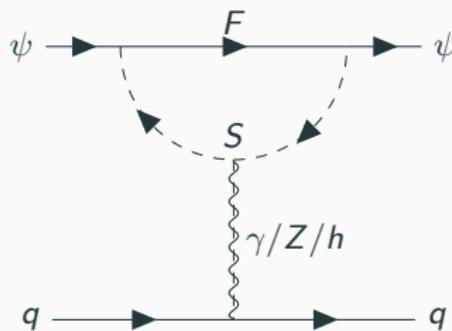

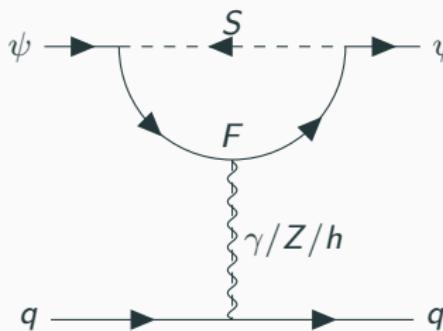

- **Direct detection:** nuclear recoil
- **Indirect detection:** cosmic rays
- **Collider search:** missing transverse energy

So far no clear evidence for DM in direct/indirect detection or at LHC

Motivation for direct detection at loop level

- no clear evidence for DM in direct/indirect detection or at lhc
- only hints from DAM.*
- option: DM is not directly coupled to quarks
- examples: fermionic singlet DM ψ such as bino, fermionic DM in scotogenic model, or models explaining the DAMPE result
- direct detection occurs at one loop
- next generation (liquid noble gas) experiments could probe it

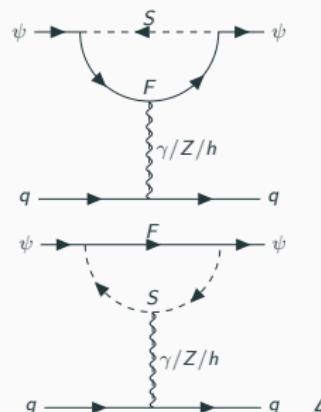

Simplified fermionic DM model

dark sector	field	$SU(3)_c$	$SU(2)_1$	$U(1)_Y$	$U(1)_{DM}$
dark matter	ψ	1	1	0	1
dark scalar	S	1	d_F	Y_F	q_S
dark fermion	F	1	d_F	Y_F	$q_S + 1$

$$\begin{aligned} \mathcal{L}_\psi = & i \bar{\psi} \not{\partial} \psi - m_\psi \bar{\psi} \psi + i \bar{F} \not{\partial} F - m_F \bar{F} F + (D_\mu S)^\dagger D^\mu S \\ & - (y_1 \bar{F_R} S \psi_L + y_2 \bar{F_L} S \psi_R + \text{h.c.}) - \lambda_{HS} v h S^\dagger S + \dots \end{aligned}$$

- Higgs portal coupling may arise in different ways
- easy to generalise to larger dark symmetry groups

Simplified fermionic DM model

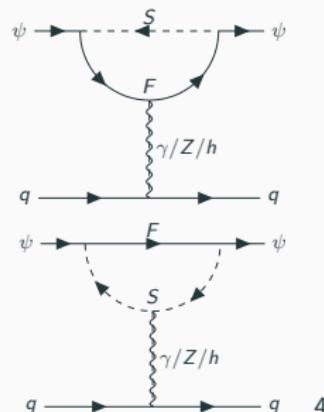

dark sector	field	$SU(3)_c$	$SU(2)_1$	$U(1)_Y$	$U(1)_{DM}$
dark matter	ψ	1	1	0	1
dark scalar	S	1	d_F	Y_F	q_S
dark fermion	F	1	d_F	Y_F	$q_S + 1$

$$\begin{aligned} \mathcal{L}_\psi = & i \bar{\psi} \not{\partial} \psi - m_\psi \bar{\psi} \psi + i \bar{F} \not{\partial} F - m_F \bar{F} F + (D_\mu S)^\dagger D^\mu S \\ & - (y_1 \bar{F_R} S \psi_L + y_2 \bar{F_L} S \psi_R + \text{h.c.}) - \lambda_{HS} v h S^\dagger S + \dots \end{aligned}$$

- Higgs portal coupling may arise in different ways
- easy to generalise to larger dark symmetry groups

SM fields in loop

1. $F \rightarrow L_L/e_R$: ψ or S have $L = 1$ LFV, EDM/AMMs, LNV
2. $F \rightarrow \nu_r$: ν_r and ψ or S have $L = 1$ Gonzalez-Macias, Escudero, ...
3. $S \rightarrow H$: mixing $\psi - F_0$, thus tree-level h/Z exchange

(Relevant) effective interactions for direct detection

Dirac DM

- Electric and magnetic dipoles: $\mathcal{L} = \mu_\psi \mathcal{O}_{\text{mag}} + d_\psi \mathcal{O}_{\text{edm}}$ [**long-range**]

$$\mathcal{O}_{\text{mag}} = \frac{e}{8\pi^2} (\bar{\psi} \sigma^{\mu\nu} \psi) F_{\mu\nu}, \quad \mathcal{O}_{\text{edm}} = \frac{e}{8\pi^2} (\bar{\psi} \sigma^{\mu\nu} i\gamma_5 \psi) F_{\mu\nu},$$

- Vector interactions from Z/γ penguins [_{anapole} $(\bar{\psi} \gamma^\mu \psi)(\partial^\nu F_{\mu\nu}) \equiv \mathcal{O}_{VV}^q$ by eom]

$$\mathcal{O}_{VV}^q = (\bar{\psi} \gamma^\mu \psi)(\bar{q} \gamma_\mu q) \quad \mathcal{O}_{AA}^q = (\bar{\psi} \gamma^\mu \gamma_5 \psi)(\bar{q} \gamma_\mu \gamma_5 q),$$

- Scalar interactions [and gluon interaction induced by heavy quarks]

$$\mathcal{O}_{SS}^q = m_q (\bar{\psi} \psi)(\bar{q} q) \quad \mathcal{O}_g = \frac{\alpha_s}{8\pi} (\bar{\psi} \psi) G^{a\mu\nu} G_{\mu\nu}^a$$

(Relevant) effective interactions for direct detection

Dirac DM

- Electric and magnetic dipoles: $\mathcal{L} = \mu_\psi \mathcal{O}_{\text{mag}} + d_\psi \mathcal{O}_{\text{edm}}$ [long-range]

$$\mathcal{O}_{\text{mag}} = \frac{e}{8\pi^2} (\bar{\psi} \sigma^{\mu\nu} \psi) F_{\mu\nu}, \quad \mathcal{O}_{\text{edm}} = \frac{e}{8\pi^2} (\bar{\psi} \sigma^{\mu\nu} i\gamma_5 \psi) F_{\mu\nu},$$

- Vector interactions from Z/γ penguins [anapole $(\bar{\psi} \gamma^\mu \psi)(\partial^\nu F_{\mu\nu}) \equiv \mathcal{O}_{VV}^q$ by eom]

$$\mathcal{O}_{VV}^q = (\bar{\psi} \gamma^\mu \psi)(\bar{q} \gamma_\mu q) \quad \mathcal{O}_{AA}^q = (\bar{\psi} \gamma^\mu \gamma_5 \psi)(\bar{q} \gamma_\mu \gamma_5 q),$$

- Scalar interactions [and gluon interaction induced by heavy quarks]

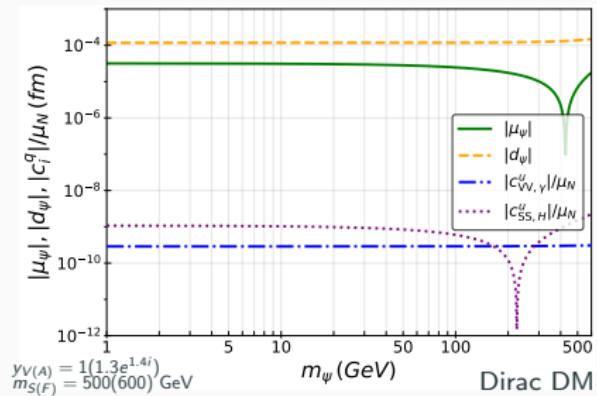

$$\mathcal{O}_{SS}^q = m_q (\bar{\psi} \psi)(\bar{q} q) \quad \mathcal{O}_g = \frac{\alpha_s}{8\pi} (\bar{\psi} \psi) G^{a\mu\nu} G_{\mu\nu}^a$$

Majorana DM

- no dipole and vector interactions
- P-violating vector interaction [momentum suppressed]

$$\mathcal{O}_{AV}^q = (\bar{\psi} \gamma^\mu \gamma_5 \psi)(\bar{q} \gamma_\mu q)$$

Dominant interactions: electric/magnetic dipole moments

for Dirac DM ψ [$m_\psi \ll m_F < m_S$]

$$\mu_\psi \approx -\frac{Q_F}{4m_S} \left(|y_V|^2 - |y_A|^2 \right) x_F \frac{1 - x_F^2 + 2 \ln x_F}{(1 - x_F^2)^2}$$

$$d_\psi \approx -\frac{Q_F}{2m_S} \operatorname{Im}[y_V^* y_A] x_F \frac{1 - x_F^2 + 2 \ln x_F}{(1 - x_F^2)^2}$$

where

$$x_F \equiv \frac{m_F}{m_S} \quad \text{and} \quad y_{V,A} = \frac{y_2 \pm y_1}{2} .$$

Dominant contribution:

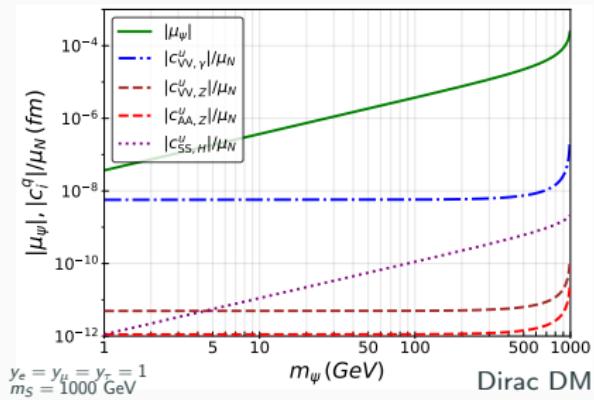

Dirac DM: electromagnetic dipole moment

Majorana DM Higgs and photon penguin

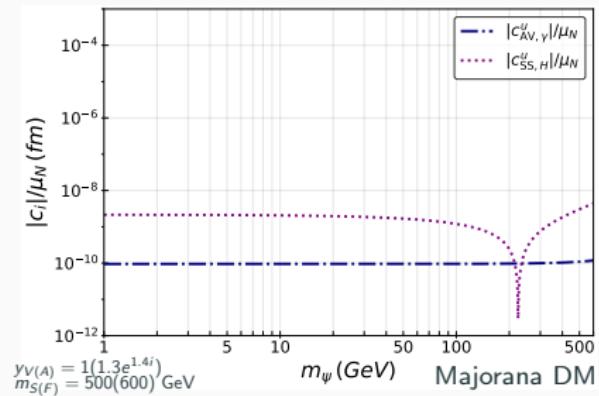

analytical expressions provided in paper
and compared to existing results

Berlin, Chang, Agrawal, Kumar, Schmidt, Kopp, Ibarra...

m_ψ dependence of μ_ψ and $c_{SS,H}^q$ due to helicity

Dominant interactions: electric/magnetic dipole moments

for Dirac DM ψ [$m_\psi \ll m_F < m_S$]

$$\mu_\psi \approx -\frac{Q_F}{4m_S} \left(|y_V|^2 - |y_A|^2 \right) x_F \frac{1 - x_F^2 + 2 \ln x_F}{(1 - x_F^2)^2}$$

$$d_\psi \approx -\frac{Q_F}{2m_S} \operatorname{Im}[y_V^* y_A] x_F \frac{1 - x_F^2 + 2 \ln x_F}{(1 - x_F^2)^2}$$

where

$$x_F \equiv \frac{m_F}{m_S} \quad \text{and} \quad y_{V,A} = \frac{y_2 \pm y_1}{2} .$$

right-handed charged leptons

connection to neutrino masses: generalised scotogenic model

Generalised scotogenic model with Dirac fermion DM

simple example of DD at loop level with radiative ν masses:

Dirac DM ψ , $F \equiv L_L$, $S = \Phi, \Phi'$. dark global (anomaly-free) $U(1)_{\text{DM}}$

field	$SU(3)_c$	$SU(2)_L$	$U(1)_Y$	$U(1)_{\text{DM}}$
Φ	1	2	1/2	1
Φ'	1	2	-1/2	1
ψ	1	1	0	1

just **one fermionic singlet** ψ needed. $\mathbf{y}_{\Phi^{(\prime)}}$ are 3-component vectors

$$\mathcal{L}_\psi \supset i\bar{\psi}\not{\partial}\psi - m_\psi\bar{\psi}\psi - (y_\Phi^\alpha\bar{\psi}\tilde{\Phi}^\dagger L_L^\alpha + (y_{\Phi'}^\alpha)^*\bar{\psi}\tilde{\Phi}'^\dagger\tilde{L}_L^\alpha + \text{h.c.}) .$$

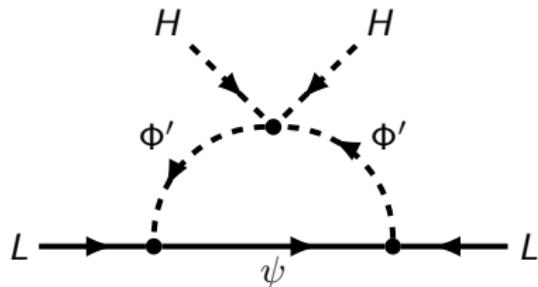

two neutral complex scalars $\eta_0^{(\prime)}$ (mixing angle θ),

two charged scalars $\eta^{(\prime)\pm}$ (no mixing)

$$V \supset \lambda_{H\Phi\Phi'} \left[(H^\dagger\tilde{\Phi}')(H^\dagger\Phi) + \text{h.c.} \right] \longrightarrow \sin 2\theta \propto \lambda_{H\Phi\Phi'} .$$

scalar DM heavily constrained by DD (mediated by Z -exchange).

Majorana neutrino mass

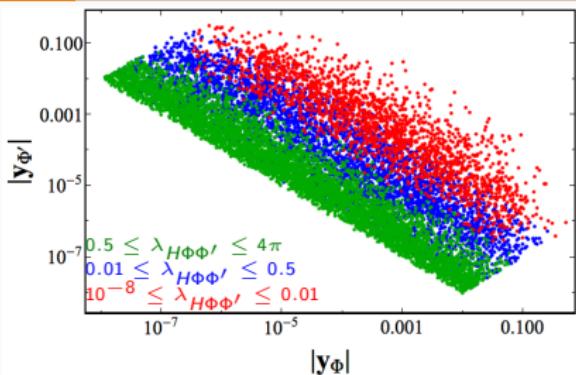

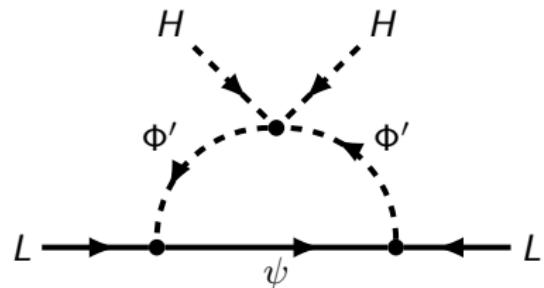

$$\mathcal{M}_\nu^{\alpha\beta} = \frac{\sin 2\theta m_\psi}{32\pi^2} (y_\Phi^\alpha y_{\Phi'}^\beta + y_{\Phi'}^\alpha y_\Phi^\beta) \left[\frac{m_{\eta_0}^2}{m_{\eta_0}^2 - m_\psi^2} \log \frac{m_{\eta_0}^2}{m_\psi^2} - (\eta_0 \leftrightarrow \eta'_0) \right]$$

lepton number L violated by combination of \mathbf{y}_Φ , \mathbf{y}'_Φ , $\lambda_{H\Phi\Phi'}$ ($\sin 2\theta$), m_ψ

m_ν is rank 2 \Rightarrow one massless neutrino

Yukawa vectors $\mathbf{y}_\Phi^{(I)}$ determined by low-energy data up to one parameter
 ζ which determines relative size of Yukawa vectors

Majorana neutrino mass

$$\mathcal{M}_\nu^{\alpha\beta} = \frac{\sin 2\theta m_\psi}{32\pi^2} (y_\Phi^\alpha y_{\Phi'}^\beta + y_{\Phi'}^\alpha y_\Phi^\beta) \left[\frac{m_{\eta_0}^2}{m_{\eta_0}^2 - m_\psi^2} \log \frac{m_{\eta_0}^2}{m_\psi^2} - (\eta_0 \leftrightarrow \eta'_0) \right]$$

lepton number L violated by combination of \mathbf{y}_Φ , \mathbf{y}'_Φ , $\lambda_{H\Phi\Phi'}(\sin 2\theta)$, m_ψ

m_ν is rank 2 \Rightarrow one massless neutrino

Yukawa vectors $\mathbf{y}_\Phi^{(i)}$ determined by low-energy data up to one parameter ζ which determines relative size of Yukawa vectors

Lepton flavour violation: $\mu \rightarrow e$ transition

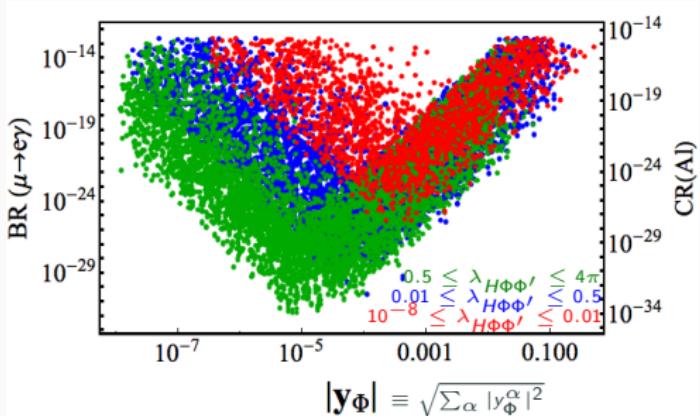

$$\text{BR}(\mu \rightarrow e \gamma) = \frac{3 \alpha_{\text{em}}}{64\pi G_F^2} \left| \frac{y_\Phi^{e*} y_\Phi^\mu}{m_{\eta^\pm}^2} f\left(\frac{m_\psi^2}{m_{\eta^\pm}^2}\right) + \frac{y_{\Phi'}^{e*} y_{\Phi'}^\mu}{m_{\eta'^\pm}^2} f\left(\frac{m_\psi^2}{m_{\eta'^\pm}^2}\right) \right|^2$$

$$\text{CR(AI)} \simeq [0.0077, 0.011] \times \text{BR}(\mu \rightarrow e\gamma) \quad \text{dipole dominance}$$

only free parameters: masses m_ψ , m_{η^\pm} , and ζ

$$\text{NO : } \mathbf{y}_{\Phi'} = \sqrt{\frac{32\pi^2}{\sin 2\theta m_\psi F}} \frac{\zeta}{\sqrt{2}} (\sqrt{m_{\text{sol}}} u_2^* \pm i\sqrt{m_{\text{atm}}} u_3^*)$$

$$\mathbf{y}_{\Phi'} = \sqrt{\frac{32\pi^2}{\sin 2\theta m_\psi F}} \frac{1}{\zeta \sqrt{2}} (\sqrt{m_{\text{sol}}} u_2^* \mp i\sqrt{m_{\text{atm}}} u_3^*)$$

with u_i being the columns of the PMNS matrix

$$\text{using } f\left(\frac{m_{\eta^\pm}^2}{m_\psi^2}\right)^{m_{\eta^\pm} \rightarrow m_\psi} \frac{1}{12}$$

$$0.0003 \frac{100 \text{ GeV}}{m_{\eta'^\pm}} \lesssim |\zeta| \lesssim 4000 \frac{m_{\eta^\pm}}{100 \text{ GeV}}$$

$\tau \rightarrow \ell\gamma$ correlated with $\mu \rightarrow e\gamma$

DM s-wave annihilations into leptons and LFV

$$\psi \text{---} \overset{\bullet}{\text{---}} \text{---} \ell^\mp/\nu \quad \overset{\bullet}{\text{---}} \text{---} \Phi^{(l)\pm}/\Phi^{(l)0} \quad \overset{\text{ch. lep.}}{\longrightarrow} \langle v\sigma_{\ell\ell} \rangle = \frac{1}{32\pi m_\psi^2} \left| y_\Phi^\alpha y_\Phi^{\beta*} \frac{m_\psi^2}{m_{\eta^\pm}^2 + m_\psi^2} - y_{\Phi'}^\alpha y_{\Phi'}^{\beta*} \frac{m_\psi^2}{m_{\eta'^\pm}^2 + m_\psi^2} \right|^2$$

only depends on masses and ζ and thus strongly constrained by LFV

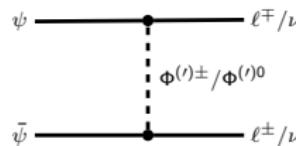

a conservative estimate

$$\sum_{\alpha,\beta} \left\langle v\sigma(\psi\bar{\psi} \rightarrow \ell_\alpha^- \ell_\beta^+, \nu_\alpha \nu_\beta) \right\rangle \lesssim 2 \times 10^{-4} \left(\frac{2.2 \times 10^{-26} \text{cm}^3/\text{s}}{\langle v\sigma \rangle_{\text{th}}} \right) \left(\frac{m}{100 \text{GeV}} \right)^2$$

for $m_{\eta'_0} \simeq m_{\eta^\pm} \simeq m_\psi \equiv m$. larger scalar masses lead to a further suppression. this is confirmed by numerical scan with micrOMEGAs.

caveat: MeV DM $m_\psi \simeq m_{\eta'_0} \ll m_{\eta^\pm}$ Boehm, Farzan, Hambye, Palomares-Ruiz, Pascoli [hep-ph/0612228]

DM s-wave annihilations into leptons and LFV

$$\xrightarrow{ch. lep.} \langle v\sigma_{\ell\ell} \rangle = \frac{1}{32\pi m_\psi^2} \left| y_\Phi^\alpha y_\Phi^{\beta*} \frac{m_\psi^2}{m_{\eta^\pm}^2 + m_\psi^2} - y_{\Phi'}^\alpha y_{\Phi'}^{\beta*} \frac{m_\psi^2}{m_{\eta'^\pm}^2 + m_\psi^2} \right|^2$$

only depends on masses and ζ and thus strongly constrained by LFV

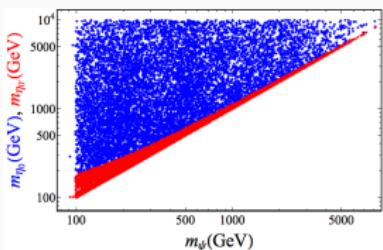

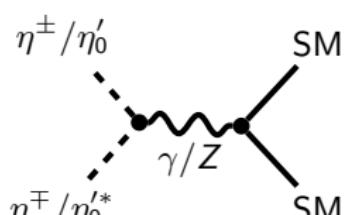

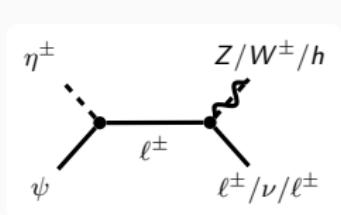

a conservative estimate

$$\frac{\sum_{\alpha,\beta} \langle v\sigma(\psi\bar{\psi} \rightarrow \ell_\alpha^- \ell_\beta^+, \nu_\alpha \nu_\beta) \rangle}{\langle v\sigma \rangle_{th}} \lesssim 2 \times 10^{-4} \left(\frac{2.2 \times 10^{-26} \text{cm}^3/\text{s}}{\langle v\sigma \rangle_{th}} \right) \left(\frac{m}{100 \text{GeV}} \right)^2$$

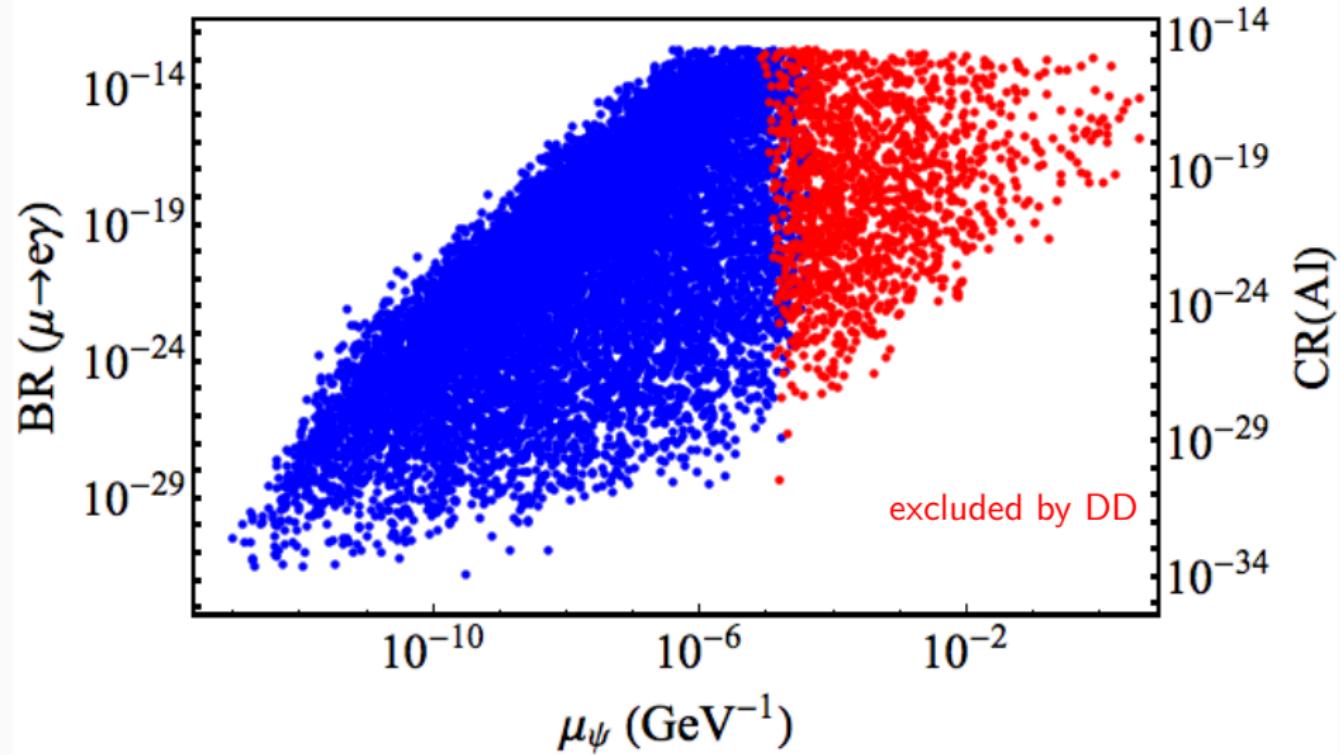

for $m_{\eta'_0} \simeq m_{\eta^\pm} \simeq m_\psi \equiv m$. larger scalar masses lead to a further suppression. this is confirmed by numerical scan with micrOMEGAs.

caveat: MeV DM $m_\psi \simeq m_{\eta'_0} \ll m_{\eta^\pm}$ Boehm, Farzan, Hambye, Palomares-Ruiz, Pascoli [hep-ph/0612228]

annihilations into leptons too small: need coannihilation with scalars $\eta^{(i)}$

Complementarity of LFV and DM direct detection

Conclusions

Conclusions

DM may not couple directly to quarks

DM - nucleus scattering only at 1-loop order (or higher)

discussion of simplified fermionic DM model

magnetic and electric dipole moment dominate

Higgs penguins are important for Majorana DM

generalised scotogenic model with Dirac fermion

fermionic DM requires coannihilation

interplay between LFV and direct detection

A plausible explanation for the lightness of neutrino masses is that neutrinos are loops. The new couplings, together with the suppression of Majorana masses at tree level, with their mass ($\sim 10^{-3}$ – 10^{-2} GeV scale), imply that the new degrees of freedom cannot be tested using different searches, making it difficult to distinguish between these models. Therefore, in particular, the new particle signals in lepton-flavor mixing, which are mainly due to neutrinos, are not yet tested.
