

# Multi-differential jet cross sections in CMS

A. Bermudez Martinez <sup>1</sup>  
on behalf of the CMS collaboration.

<sup>1</sup>Deutsches Elektronen-Synchrotron (DESY)

August 2017

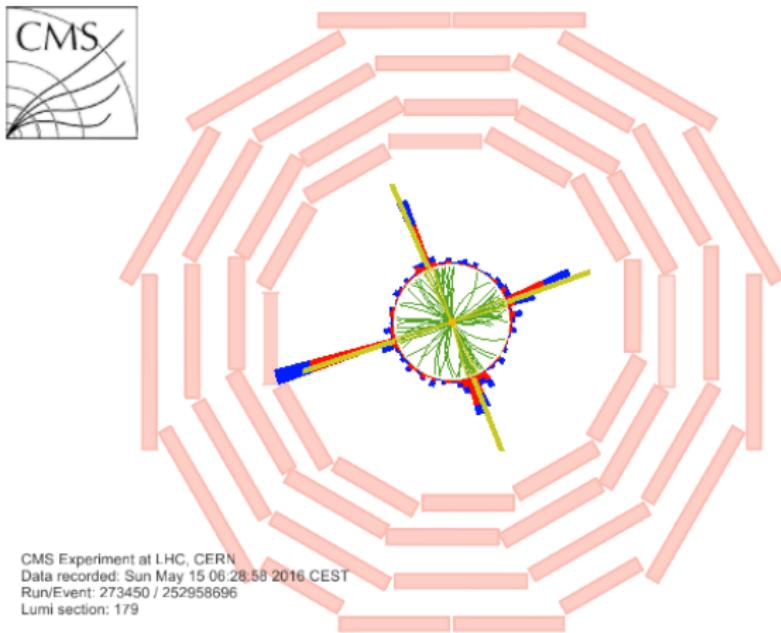

# QCD

- Main background to almost any interesting and rare event at a hadron collider.
- Understood in terms of factorization theorems.
- Extraction of  $\alpha_s$  and PDFs.
- Many subtleties remain unclear (MM schemes, PS and resummation, factorization breaking and soft gluons color correlations...)

## Jets measurements

- Partons express themselves through collimated streams of hadrons.

Double-differential inclusive jets cross sections  
in pp collisions at  $\sqrt{s} = 8\text{TeV}$   
DOI: [10.1007/JHEP03\(2017\)156](https://doi.org/10.1007/JHEP03(2017)156)

Double-differential inclusive jet cross sections  
in pp collisions at  $\sqrt{s} = 13\text{TeV}$   
DOI: [10.1140/epjc/s10052-016-4286-3](https://doi.org/10.1140/epjc/s10052-016-4286-3)

# Inclusive jets cross sections @8TeV and 13TeV

$$\frac{d^2\sigma}{dp_T dy} = \frac{1}{\epsilon \mathcal{L}_{\text{int,eff}}} \frac{N_{\text{jets}}}{\Delta p_T(2\Delta|y|)}$$

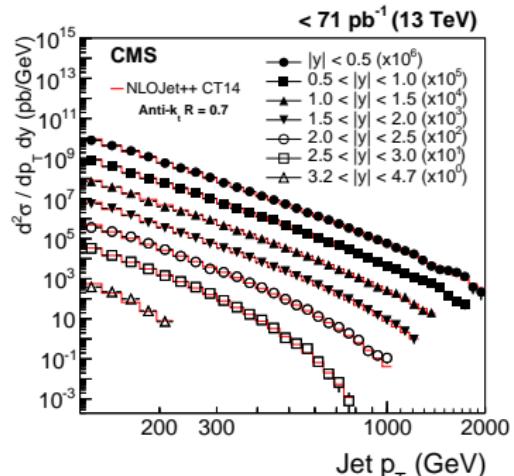

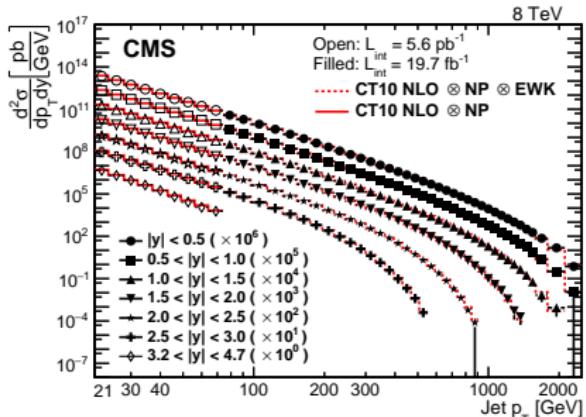

- $p + p \rightarrow \text{jet} + X$  probes parton-parton interaction (Benchmark QCD test)
- Sensitive to  $\alpha_s$
- Provides important PDFs constraints
- QCD describes data over 14 orders of magnitude!!
- Experimental uncertainties dominated by JES, unfolding and the integrated luminosity.
- Strongly  $p_T$  and  $y$  dependent PDF uncertainties (dominant)

## Inclusive jets cross sections @8TeV

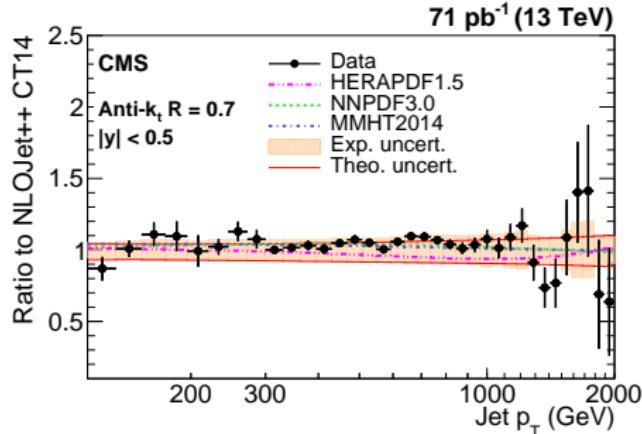

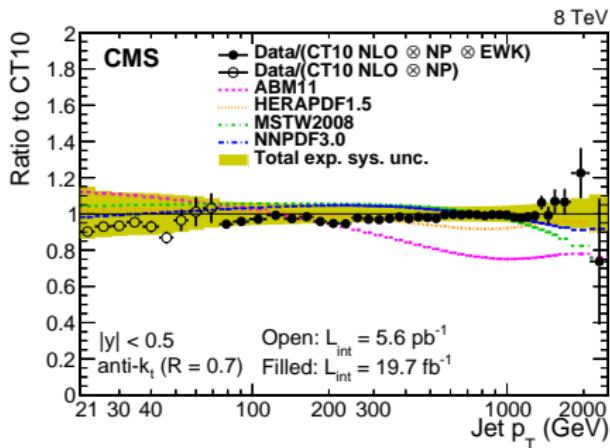

- anti- $k_t$ 7, bins of rapidity  $\in [0, 4.7]$

## Inclusive jets cross sections @13TeV

- anti- $k_t$ 4 and anti- $k_t$ 7, bins of rapidity  $\in [0, 4.7]$

## Inclusive jets cross sections @8TeV and 13TeV

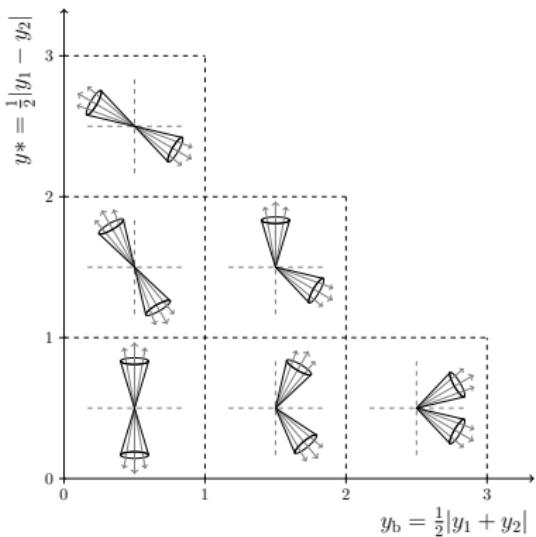

- Predictions are in good agreement with data
- More can be learnt from these measurements → see next slides

Measurement of the triple-differential dijet cross section  
in pp collisions at  $\sqrt{s} = 8\text{TeV}$

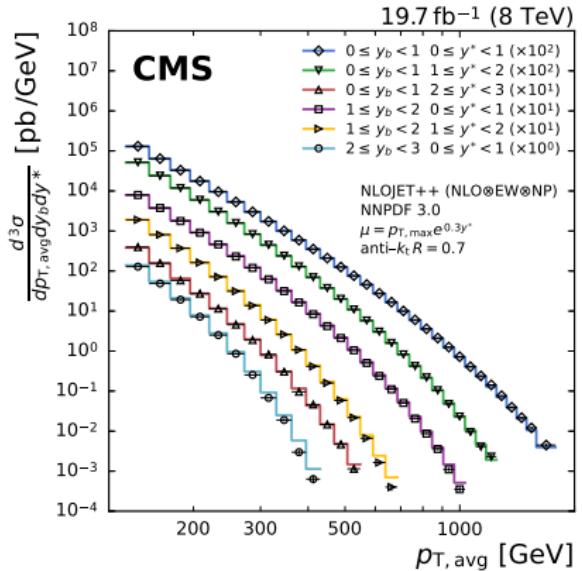

arXiv: 1705.02628

# Triple differential dijet cross section @8TeV

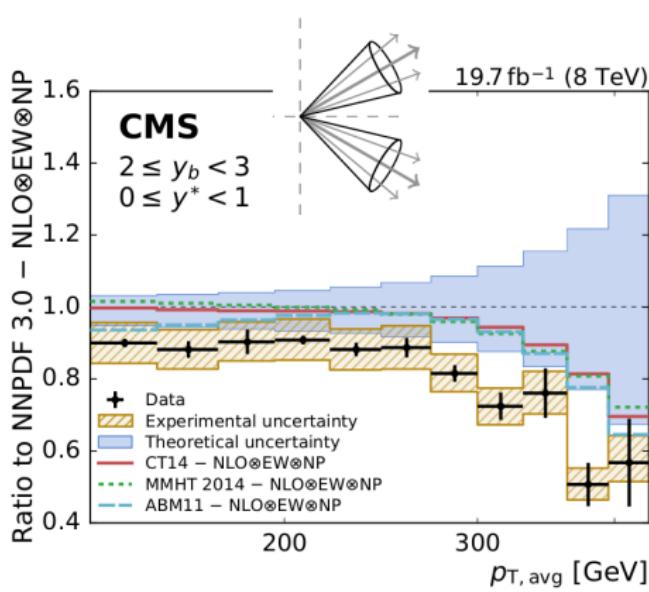

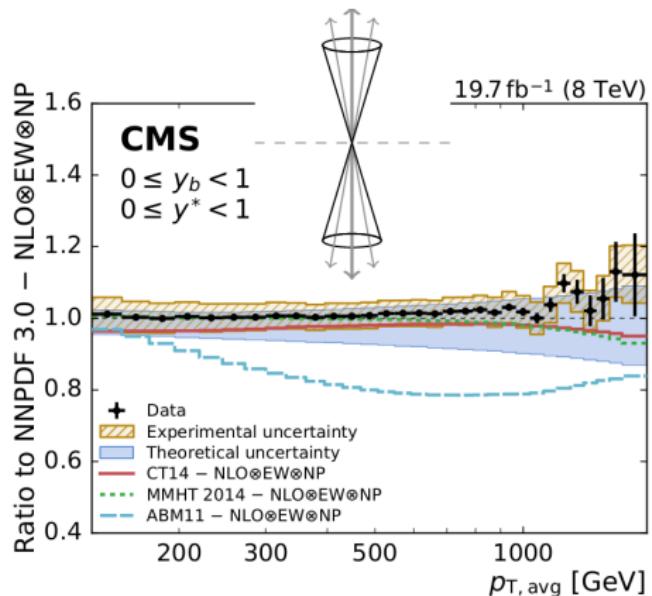

$$\frac{d^3\sigma}{dp_{T,\text{avg}}dy^*dy_b} = \frac{1}{\epsilon \mathcal{L}_{\text{int,eff}}} \frac{N}{\Delta p_{T,\text{avg}} \Delta y^* \Delta y_b}$$

- $p_{T,\text{avg}}$  leading jets average  $p_T$
- $y^* = |y_1 - y_2|/2$
- $y_b = |(y_1 + y_2)|/2$

- Test of pQCD
- Determination of coupling constant
- Constraints on PDFs

# Triple differential dijet cross section @8TeV

- For mid-x ( $\sim$  partonic momentum fraction) regions data are well described
- Boosted topologies (large-x) lacks from PDF information
- Significantly small uncertainties at large-x → potential constraints on PDF

## PDF constraints

- Largest impact on the high-x region
- PDF uncertainty from experimental, model, and parameterisation uncertainty

## $\alpha_s$ extraction

$$\frac{d^2\sigma}{dp_T dy} \propto \alpha_s^2 \text{ (2→2 LO)}$$

- $\alpha_s$  an additional free parameter in the PDF fit

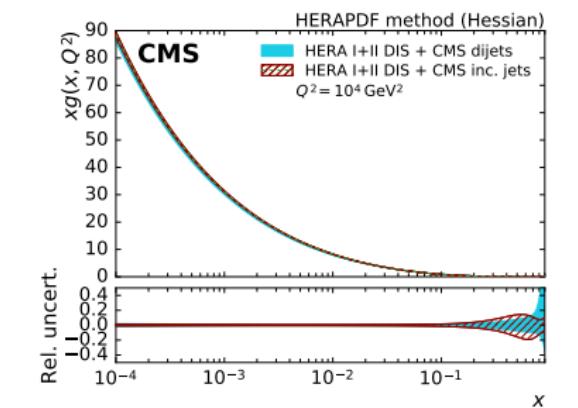

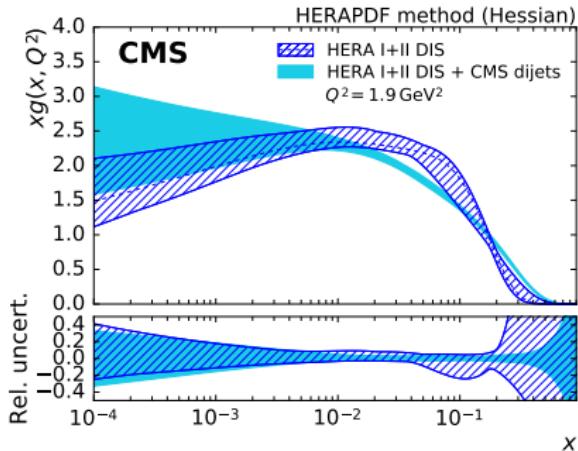

$$\alpha_s(M_Z) = 0.1199 \pm 0.0015 (\exp)^{+0.0002}_{-0.0002} (\text{mod})^{+0.0002}_{-0.0004} (\text{par})$$

$$\Delta \alpha_s(M_Z) = {}^{+0.0026}_{-0.0016} \text{ (scale, refit)}$$

- $\alpha_s$  measurement dominated by theory uncertainties

- World average value:

$$\alpha_s(M_Z) = 0.1181 \pm 0.0011$$

Strong coupling constant from the measurement  
of inclusive multijet event cross sections in pp collisions at  $\sqrt{s} = 8\text{TeV}$

---

to be published (CMS PAS SMP-16-008)

## Inclusive 2-jets, 3-jets and $R_{32}$

$$\frac{d^2\sigma}{d(H_{T,2}/2)} = \frac{1}{\epsilon \mathcal{L}_{\text{int,eff}}} \frac{N_{\text{event}}}{\Delta(H_{T,2}/2)}$$

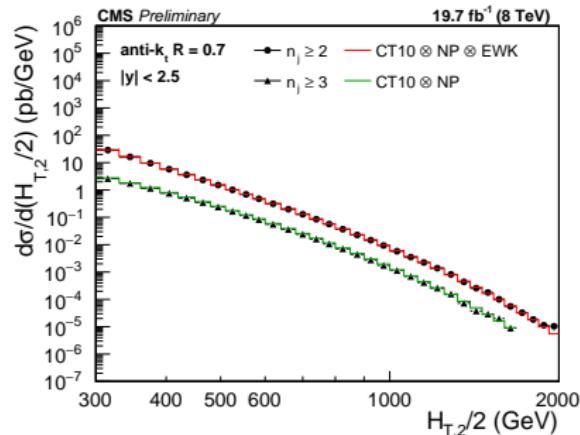

$H_{T,2}/2$ : leading jets average  $p_T$ , and scale of the event

- Inclusive 3-jets, inclusive 2-jets were studied

$$R_{32} = \frac{d\sigma_3}{d\sigma_2} \propto \alpha_s$$

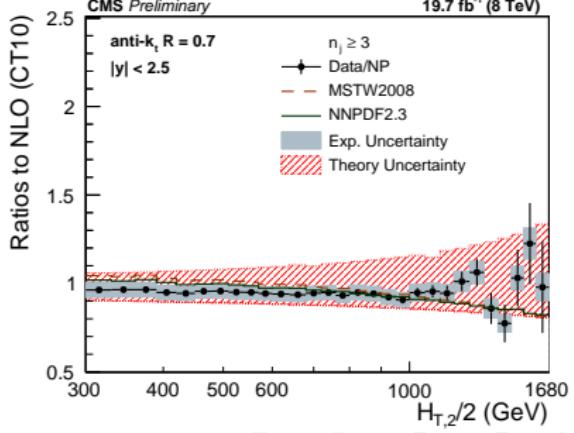

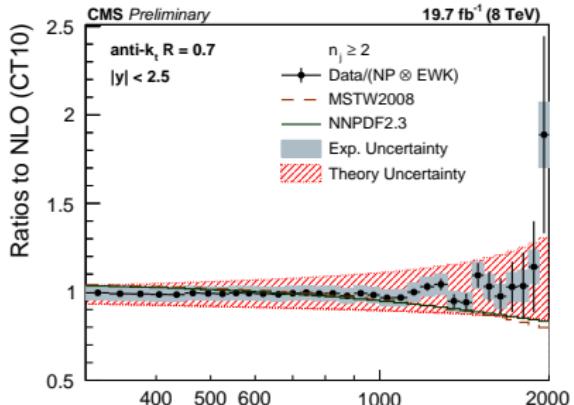

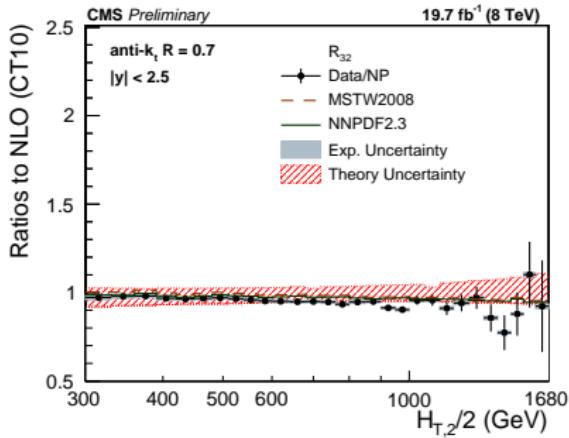

- JES is the dominant systematic uncertainty for  $\sigma_2$  (3-10%) and  $\sigma_3$  (3-8%)

-  $R_{32} \rightarrow$  theoretical and experimental uncertainties partially cancel (exp. uncertainties  $\sim 1\%$ )

# Inclusive 2-jets, 3-jets and $R_{32}$

- Data are well described by the predictions
- Uncertainties: large  $H_{T,2}/2 \rightarrow$  PDF dominates in the upward direction, scale uncertainties in the downward direction
- $R_{32} \rightarrow$  uncertainties significantly reduced.

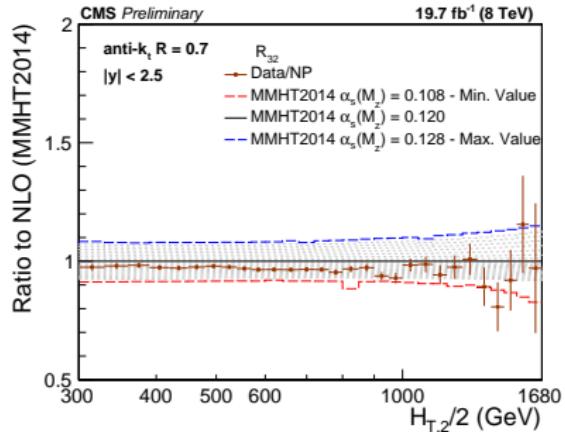

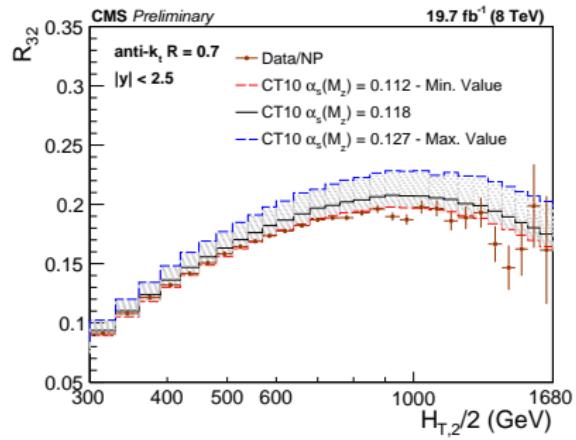

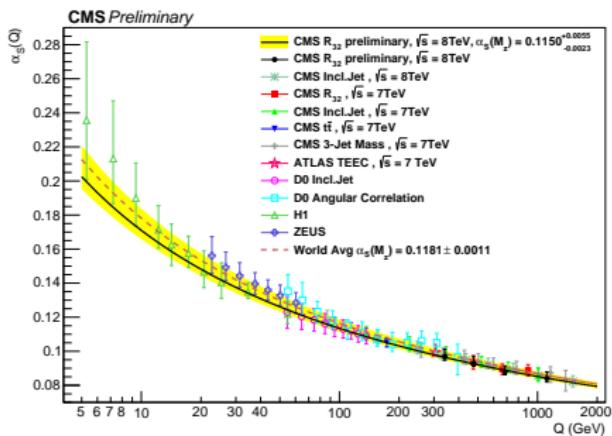

## $\alpha_s$ extraction

- Minimizing the  $\chi^2$  between the experimental measurement and the theoretical predictions

- Using MSTW2008 PDF:

$$\alpha_s(M_Z) = 0.1150 \pm 0.0010(\text{exp}) \pm 0.0013(\text{PDF}) + \pm 0.0015(\text{NP})^{+0.0050}_{-0.0000} (\text{scale})$$

- Result for  $\alpha_s(M_Z)$  is in agreement with the world average value of  
 $\alpha_s(M_Z) = 0.1181 \pm 0.0011$

Measurement of angular and momentum distributions  
in multi-jet final states at  $\sqrt{s} = 8\text{TeV}$  and  $13\text{TeV}$

not yet released (CMS PAS SMP-17-008)

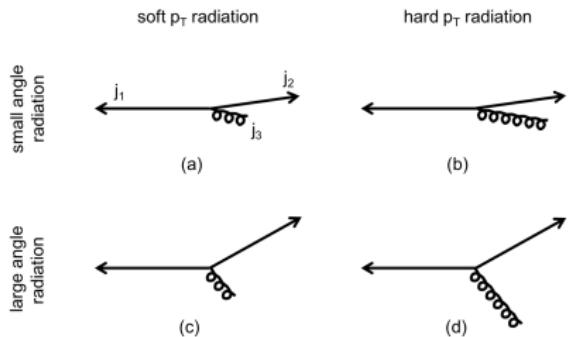

## Multi-jets correlations @8TeV and 13TeV

- Interplay between parton showers and Matrix Elements

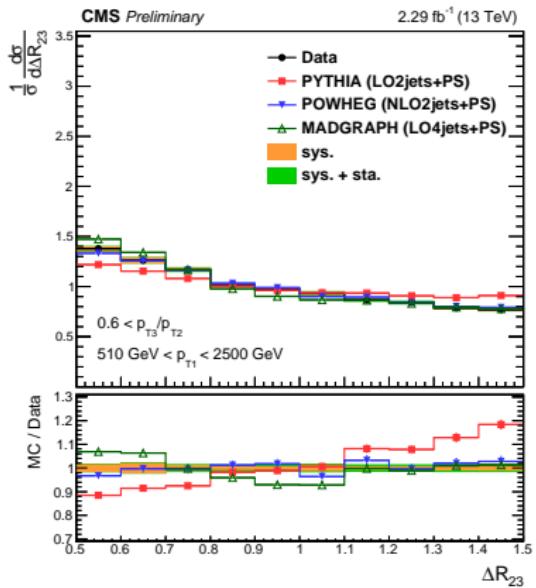

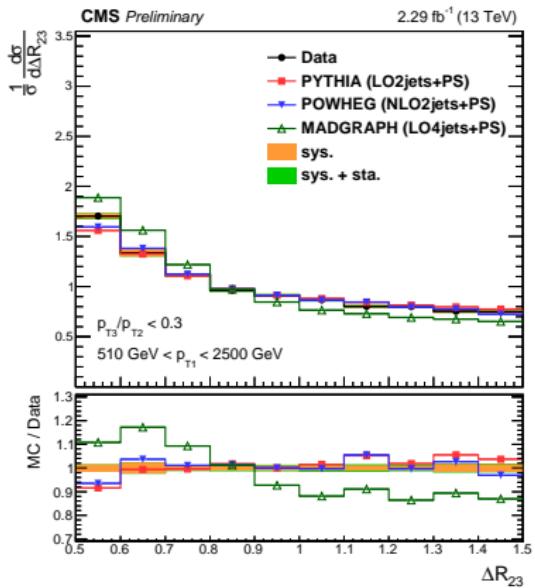

- Soft and hard radiation sensitivity  $\rightarrow p_{T3}/p_{T2}$

- Collinear and wide angle radiation sensitivity  
 $\rightarrow \Delta R_{23}$

Criteria	Radiation type
$p_{T3}/p_{T2} < 0.3$	soft $p_T$ radiation
$p_{T3}/p_{T2} > 0.6$	hard $p_T$ radiation
$\Delta R_{23} < 1.0$	small angle radiation
$\Delta R_{23} > 1.0$	large angle radiation

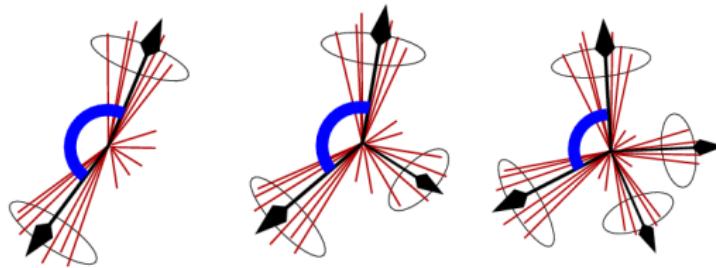

# Multi-jets correlations @8TeV and 13TeV

- All theoretical predictions show significant deviations from the measurements
- Contribution from higher order ME calculations supplemented with parton showers are necessary for describing the hard region

## Measurements of inclusive 2-jet, 3-jet and 4-jet azimuthal correlations in pp collisions at 13TeV

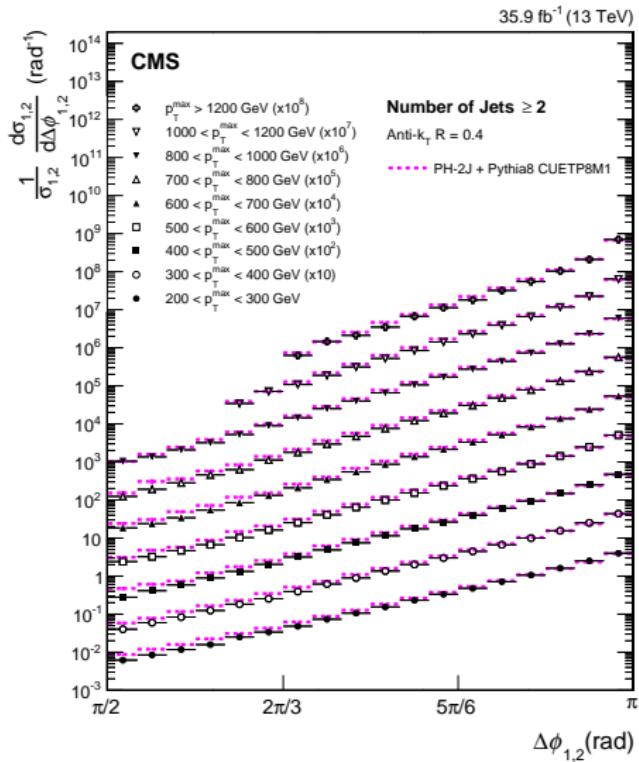

to be published (CMS PAS SMP-16-014)

# Dijet cross section @13TeV

$$\frac{1}{d\sigma_{1,2}} \frac{d\sigma_{1,2}}{d\Delta\phi_{1,2}}$$

- Bin size  $5^\circ$  - Interesting tool to test theoretical predictions of multijet production processes
  - Region away from  $\pi$  is sensitive to hard radiation from ME
  - Region close to  $\pi$  is sensitive to resummed contributions from PS
- Overall description of the data is achieved and understood
- JES is the dominant systematic uncertainty (from 3% at  $\pi/2$  to 0.1% at  $\pi$ )

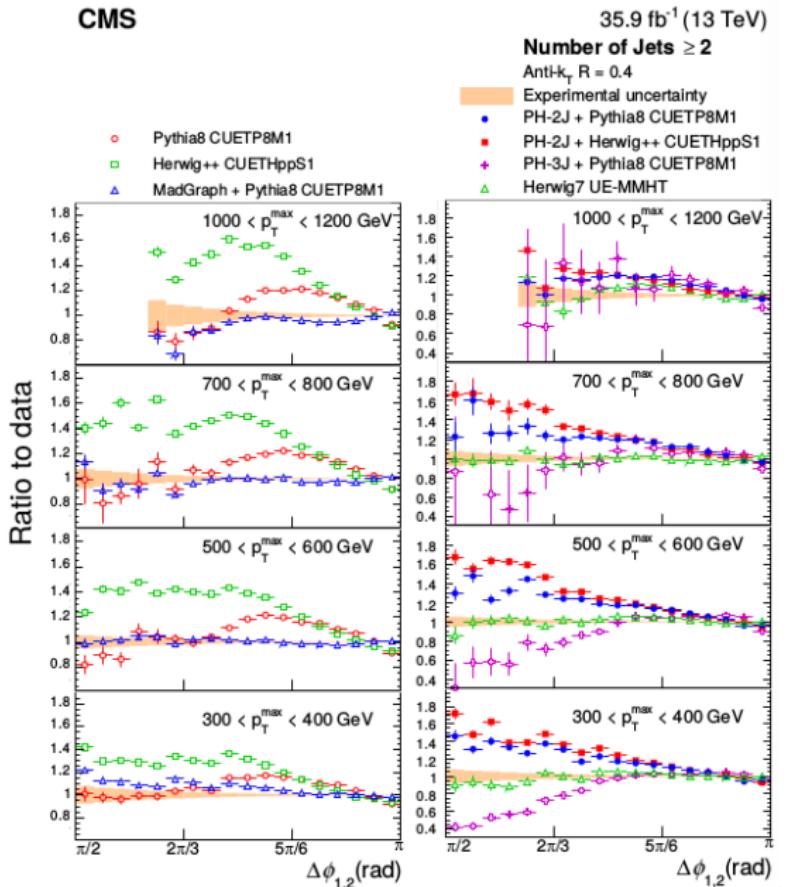

# Dijet azimuthal angular correlations

- MadGraph (up to 2→4 LO) describes well the data whereas P8 and Herwig++ (2→2 LO) fail significantly

- Powheg 2J and Powheg 3J are not able to describe the data better than P8 and Herwig++, even though they provide multi-leg ME

- Herwig7 (MC@NLO for matching to PS), formally NLO but effectively 2→3 LO, gives a good description of the data

- For this observable MC@NLO method of combining parton shower with the NLO parton level calculations has advantages compared to the POWHEG method

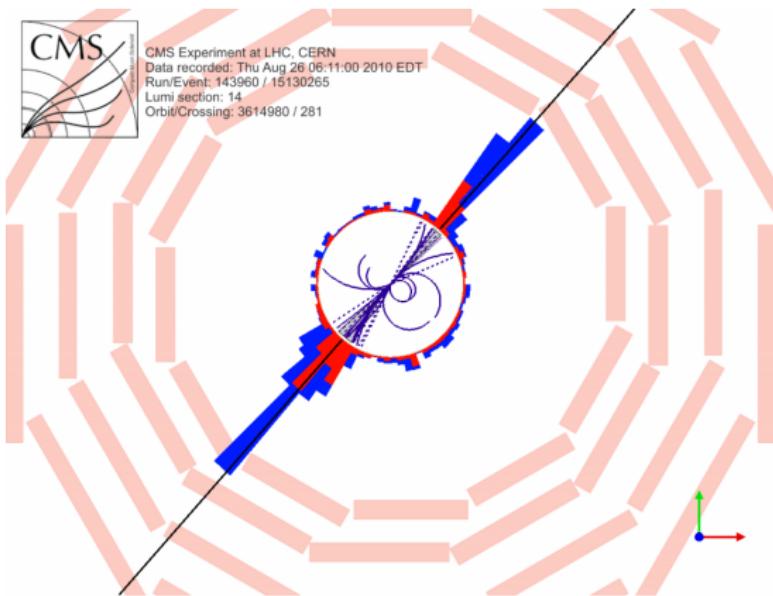

# Azimuthal angular correlations in high transverse momentum dijet events

---

## in high transverse momentum dijet events

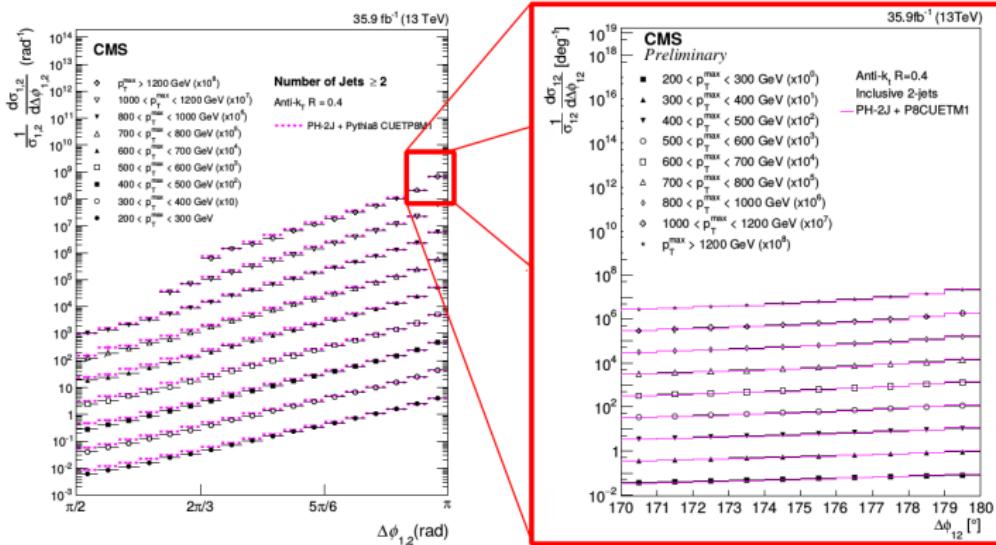

not yet released (CMS PAS SMP-17-009)

# Dijet azimuthal correlations in inclusive 2-jets events

$$\frac{1}{d\sigma_{1,2}} \frac{d\sigma_{1,2}}{d\Delta\phi_{1,2}}$$

- In inclusive 2-jets and 3-jets events
- Finer binning of  $1^\circ$
- Detailed investigation of the resummation region ( $\Delta\phi \sim 180^\circ$ )
- Testing the resummed predictions coming from different Parton Shower models
- Studying matching and merging formalisms
- Soft radiation interference and factorization breaking

# Dijet azimuthal correlations in inclusive 2-jets events

CMS

Preliminary

anti- $k_t$  R=0.4

Inclusive 2-jets

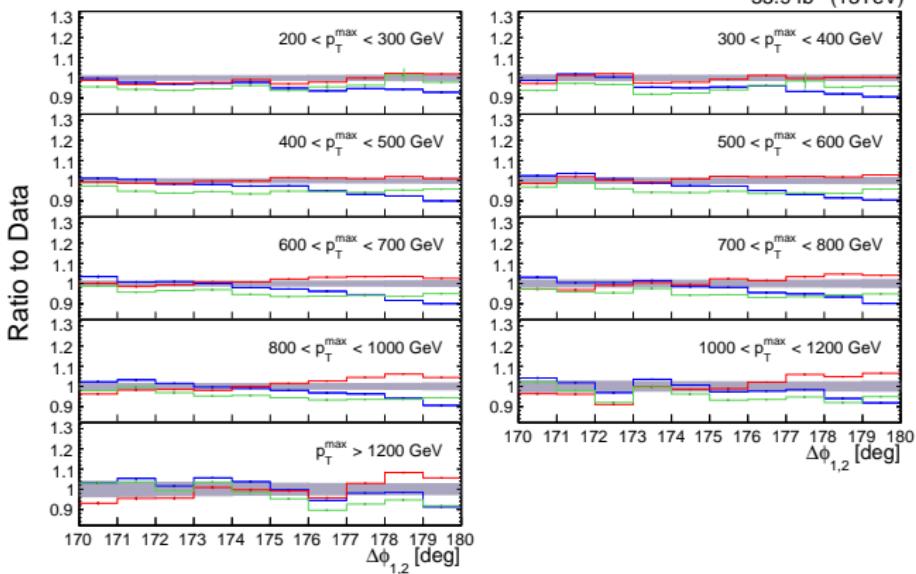

Total Syst. Unc.

Pythia8 CUETM1

Herwig++ CUETHppS1

MadGraph + P8CUETM1

35.9 fb<sup>-1</sup> (13TeV)

- MadGraph gives the best description, and starts to fail towards high  $p_T^{\max}$
- P8 and Herwig++ perform similarly
- Differences of up to 10%
- Pythia8 and Herwig++ resum in the same way (only evolution variable differs)
- There are correlations towards high  $p_T^{\max}$  which are not captured either by the parton shower nor the multi-leg final state ME from MadGraph

# Dijet azimuthal correlations in inclusive 2-jets events

CMS

Preliminary

anti- $k_t$  R=0.4

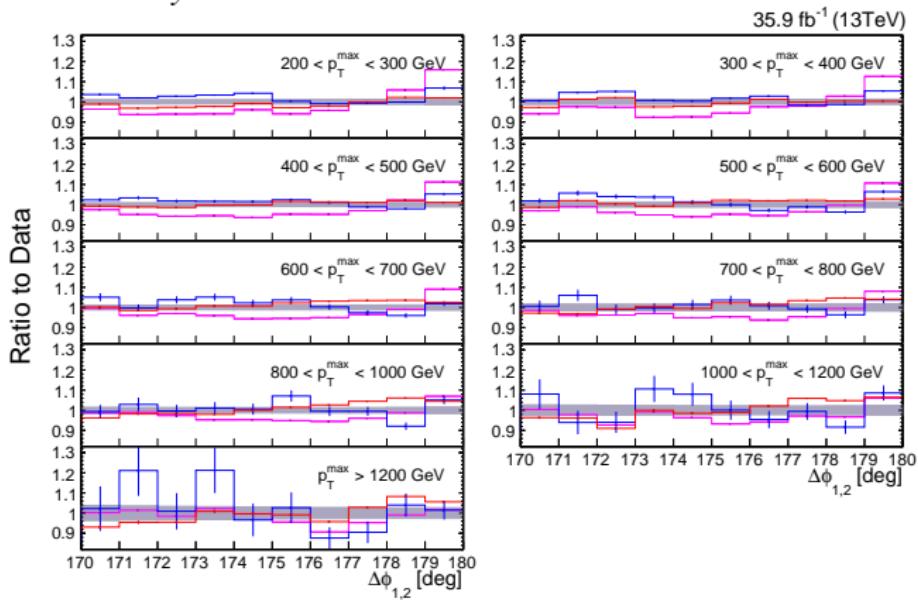

Inclusive 2-jets

Total Syst. Unc.

PH-2J + P8CUETM1

PH-3J + P8CUETM1

MadGraph + P8CUETM1

- MadGraph and Powheg 3J give the best description
- Powheg 2J fails to describe the data
- Biggest discrepancies in the last bin

- MadGraph and Powheg 3J, both go up to 2→4 partons
- Powheg 2J is effectively 2→3 LO

# Dijet azimuthal correlations in inclusive 3-jets events

CMS

Preliminary

anti- $k_t$  R=0.4

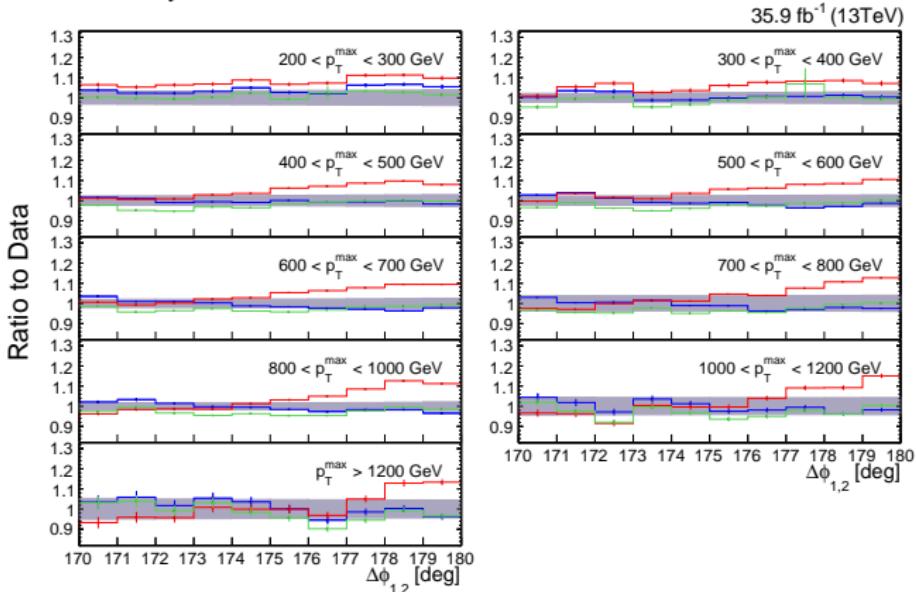

Inclusive 3-jets

Total Syst. Unc.

Pythia8 CUETM1

Herwig++ CUETHppS1

MadGraph + P8CUETM1

- Two scale process by requiring at least a third jet with  $p_T > 30$  GeV
- MadGraph fails in up to 15% despite the fact that it performs well in the inclusive 2-jets case

- Pythia and Herwig++ describe the data in all the  $p_T^{\max}$  regions

# Dijet azimuthal correlations in inclusive 3-jets events

CMS

Preliminary

anti- $k_t$  R=0.4

Inclusive 3-jets

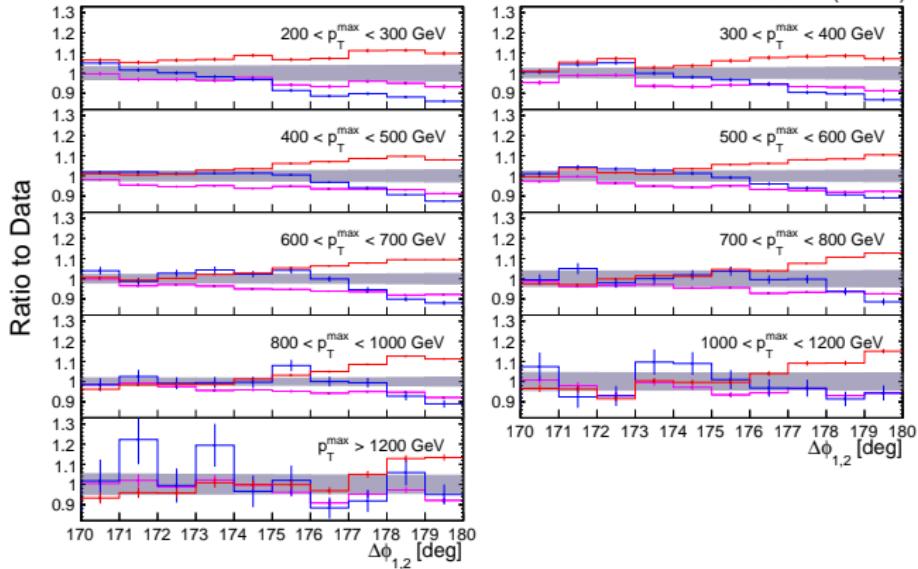

PH-2J + P8CUETM1

PH-3J + P8CUETM1

MadGraph + P8CUETM1

Total Syst. Unc.

35.9 fb<sup>-1</sup> (13TeV)

- MadGraph, Powheg 2J and Powheg 3J fail to describe the data in up to 10% towards  $180^\circ$
- Powheg 2J and Powheg 3J have a similar trend

- Decorrelations in the 3-jets inclusive case are well described by partons coming from PS exclusively, whereas a mixture of partons from PS and ME are not able to

# Summary

## Inclusive jet cross sections @ $\sqrt{s} = 8$ and $\sqrt{s} = 13\text{TeV}$

- Sensitive to  $\alpha_s$
- Provides important PDFs constraints
- QCD describes data within 14 orders of magnitude!!
- Experimental uncertainties dominated by JES, unfolding and the integrated luminosity.

## Measurement of the triple-differential dijet cross section

- Test of pQCD
- Determination of coupling constant and constraints on PDF

## Strong coupling constant from inclusive multijet events

- Test of QCD
- $R_{32}$  is used to extract  $\alpha_s$

## Multi-jets correlations @8TeV and 13TeV

- Interplay of ME and PS when dealing with soft and hard scales
- In general, the theoretical predictions show significant deviations from the measurements

## Dijet azimuthal angular correlations @ $\sqrt{s} = 13\text{TeV}$

- Overall description of the data is achieved and understood
- For this observable MC@NLO method of combining parton shower with the NLO parton level calculations has advantages compared to the POWHEG method

## Azimuthal angular correlations in high transverse momentum dijet events

- Multi-leg final state MC Powheg 3J and Madgraph provide a good description of the data for 2-jet inclusive events
- They start to fail towards high  $p_T^{\max}$  were presumably non-trivial correlations appears
- For 3-jet inclusive events, partons coming exclusively from PS describe the observed  $\Delta\phi_{1,2}$ , whereas the merged/matched results from Madgraph, Powheg2J and Powheg 3J don't

Thank you for your attention.
