Higgs Physics at the LHC

Search for Higgs decays at CMS

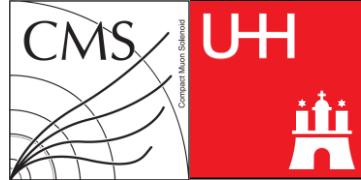

- Higgs sector studied intensively in the last years
- Coupling to 3rd generation & gauge bosons
- no significant deviations from SM found

SM like coupling or new physics?!

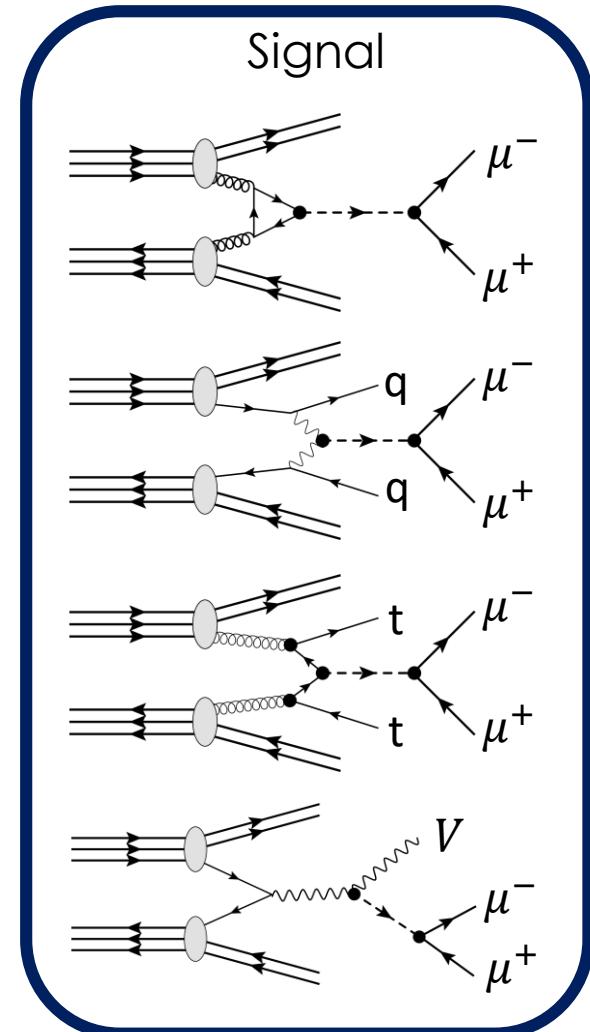

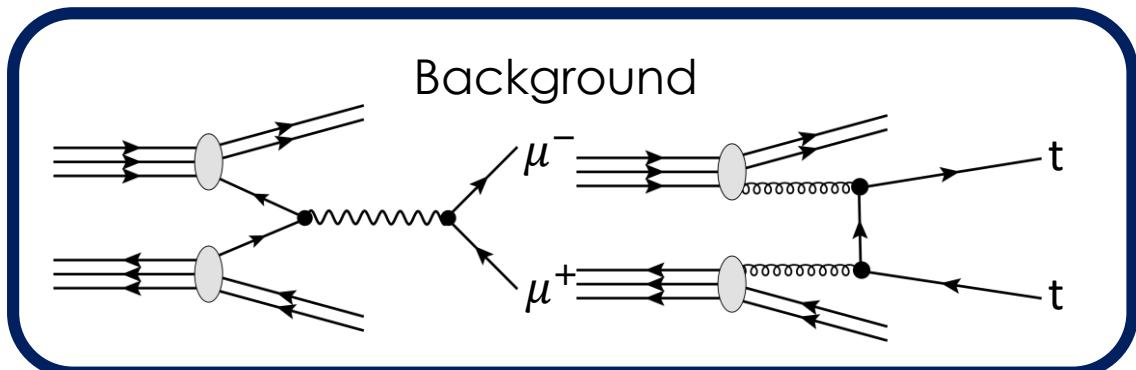

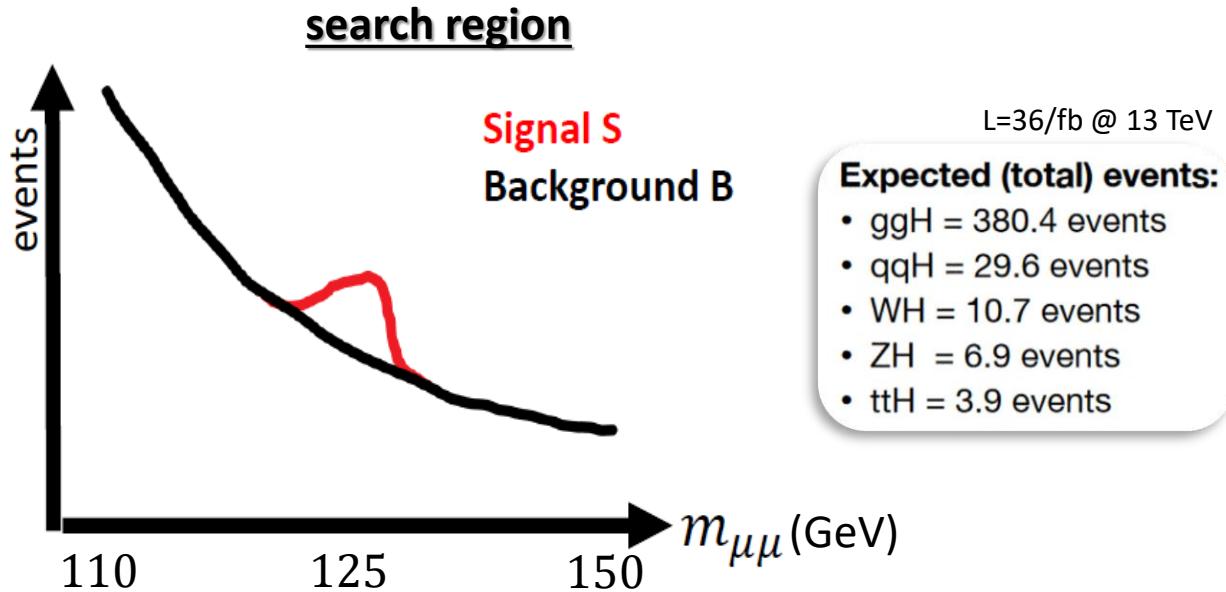

- test direct coupling to fermions
- confirm coupling of Higgs boson to 2nd gen

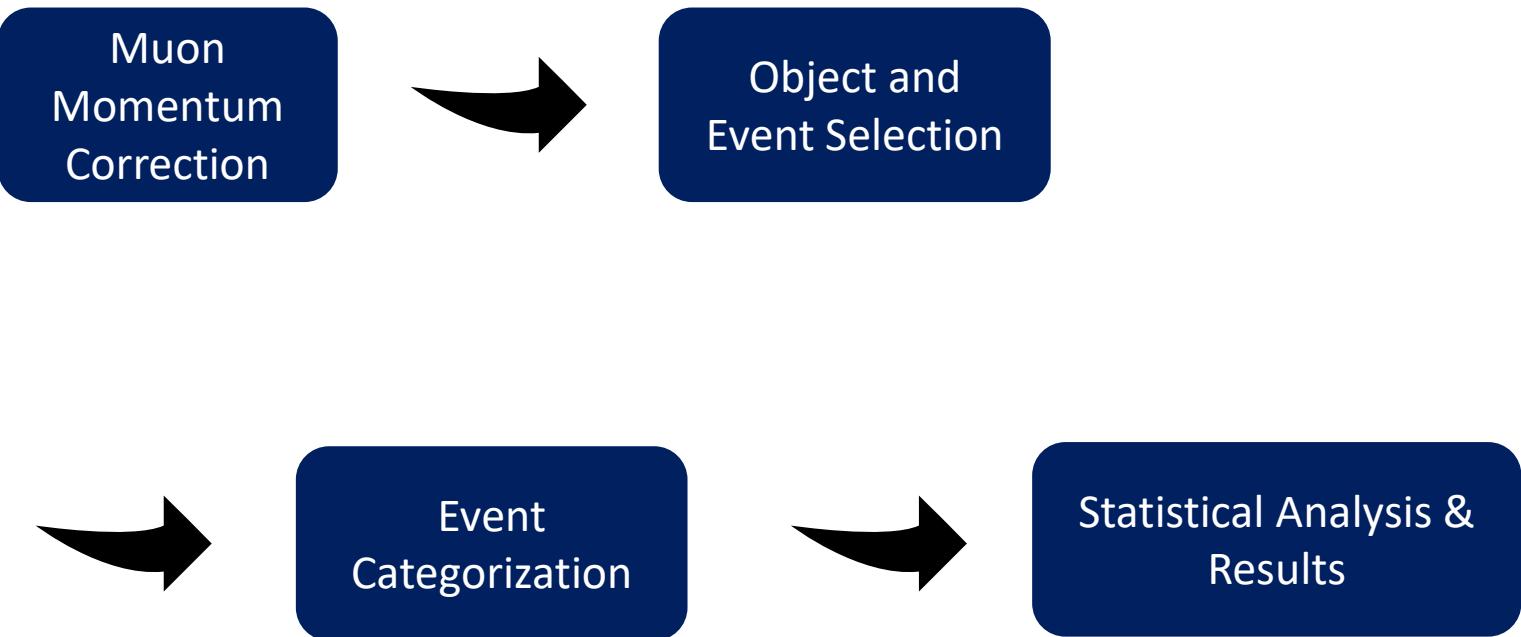

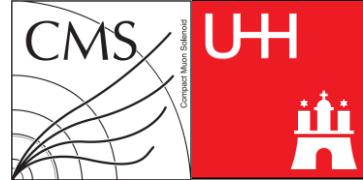

Higgs Physics at the LHC

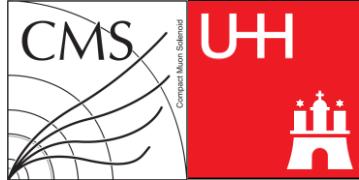

- very precise mass resolution of dimuon pair
- irreducible background from Drell Yan events

Analysis Concept

Muon Momentum Calibration

muon momentum is influenced by:

- detector misalignments
- reconstruction software
- uncertainties in the magnetic field
- differences between data/MC

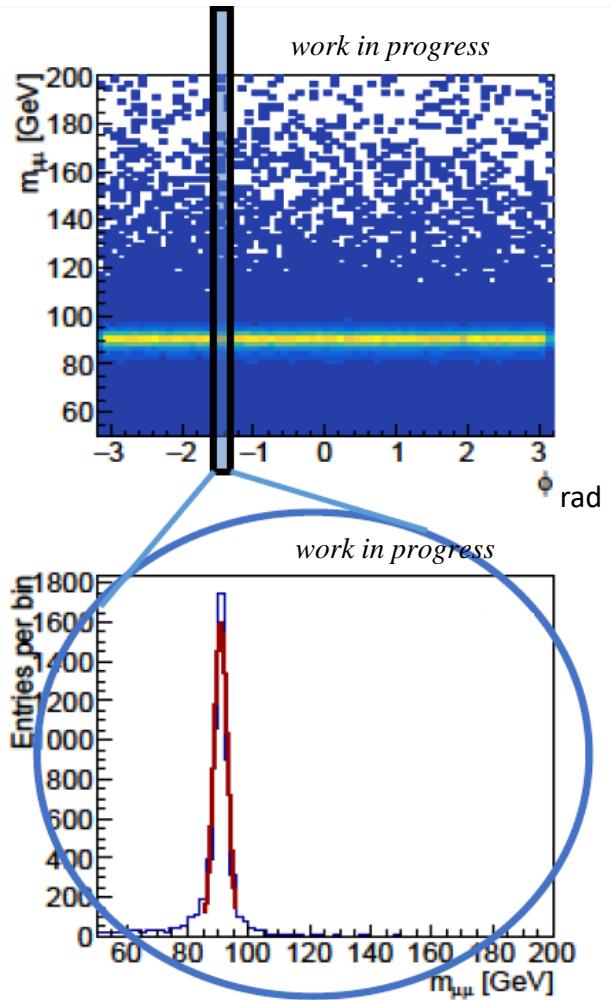

Correction method by Rochester University

References for the method :

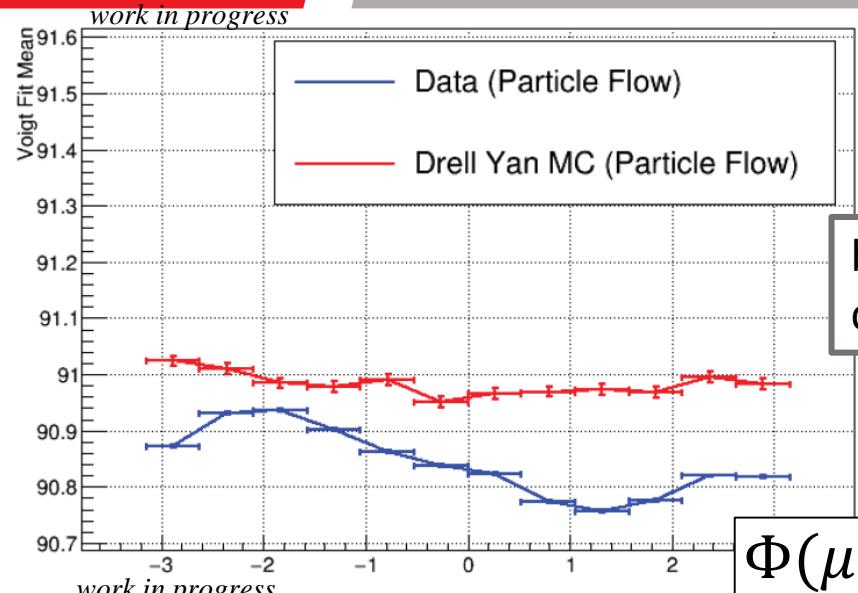

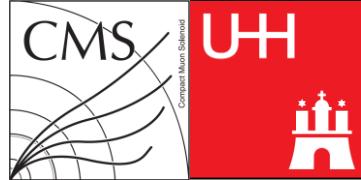

EPJC V72, 10.2194 (2012) (arXiv:1208.3710[hep-ex])

test corrections:

- select events in data: $Z \rightarrow \mu\mu$
- probe figure of merit Φ vs $m_{\mu\mu}$

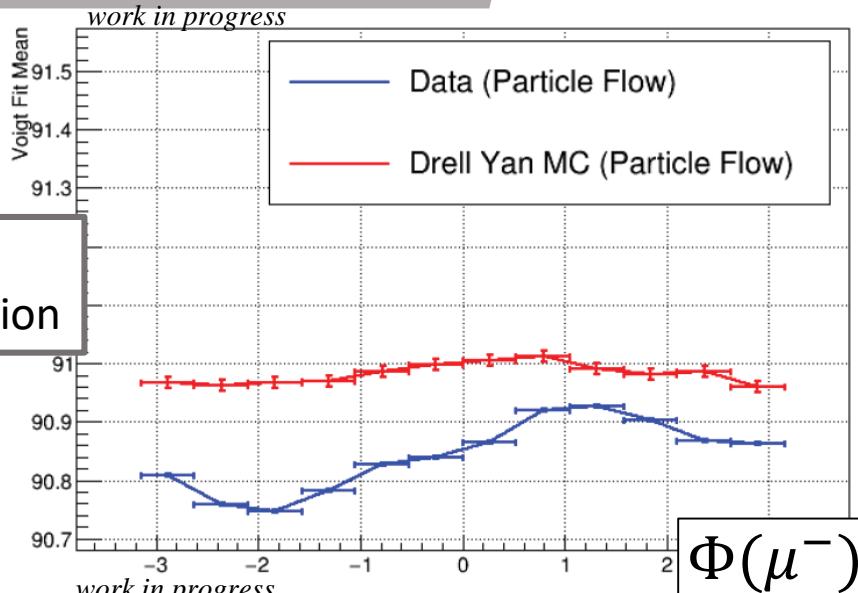

Muon Momentum Calibration

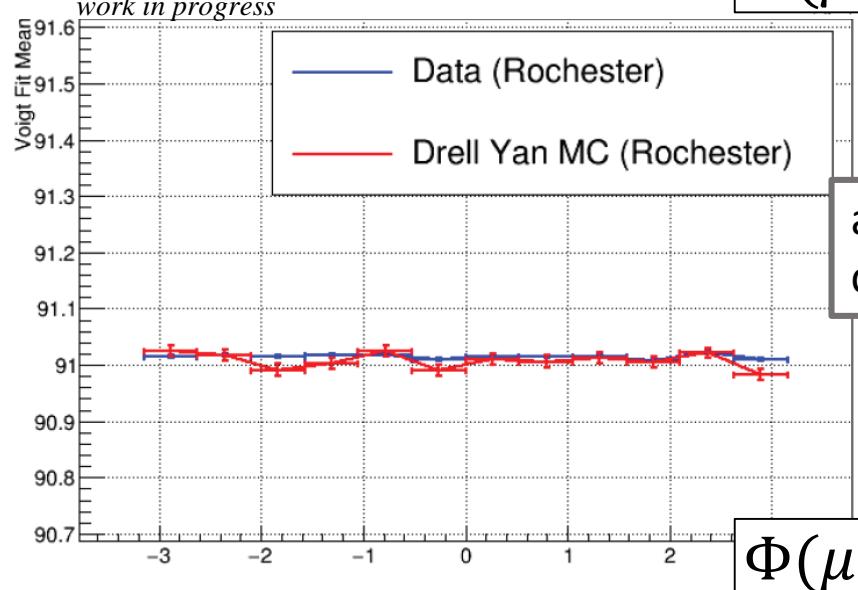

before
correction

$\Phi(\mu^+)$

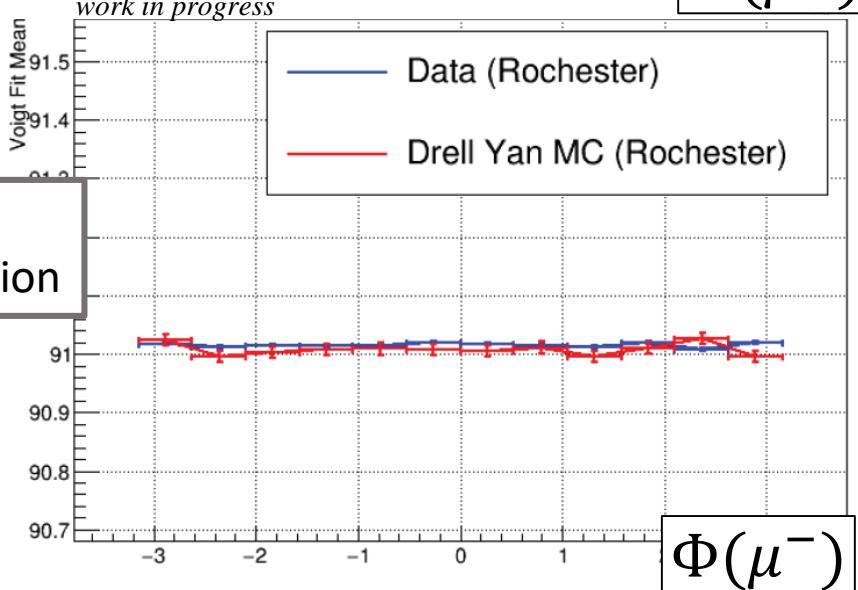

$\Phi(\mu^-)$

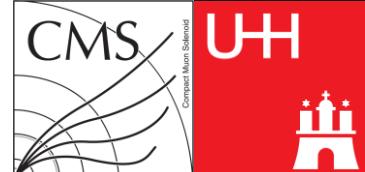

after
correction

$\Phi(\mu^+)$

$\Phi(\mu^-)$

Object & Event Selection

Physics Objects Selection

Muons

- medium ID
- Loose Iso 0.25
- Eta < 2.4 & Pt > 20 GeV
- Global
- Trigger/ID/Iso SF

Jets

- Loose ID
- Eta < 4.7 & Pt > 30 GeV
- B-tag medium
(secondary vertex algorithm)
- Cleaned against muons ($R < 0.4$)

Event Selection and Corrections

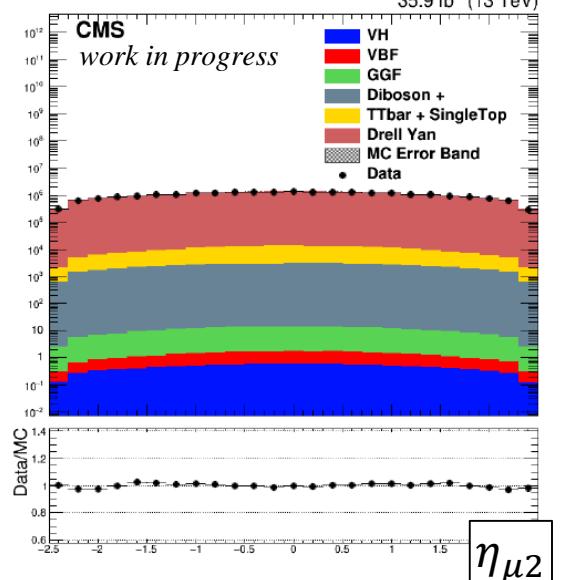

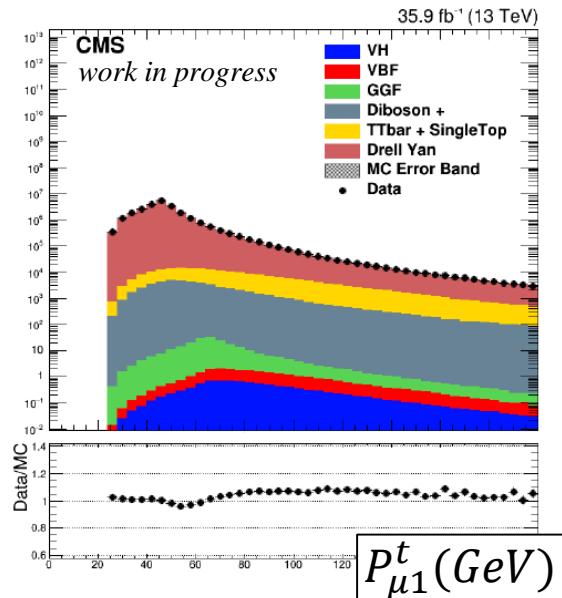

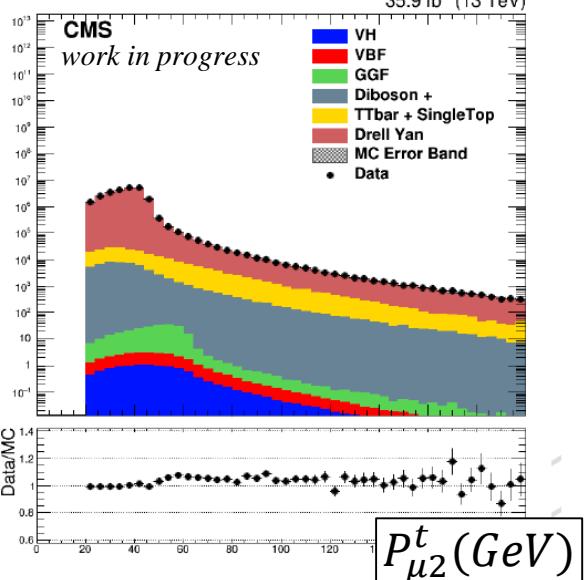

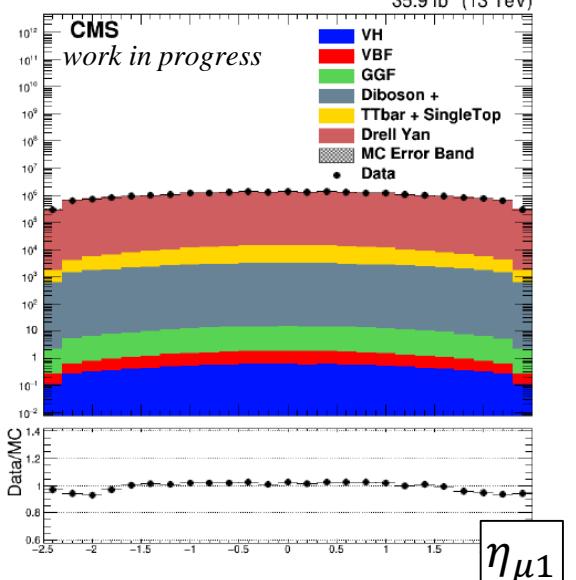

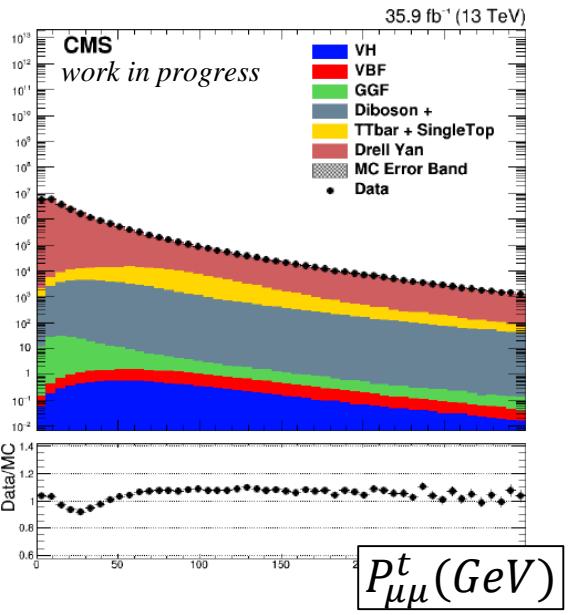

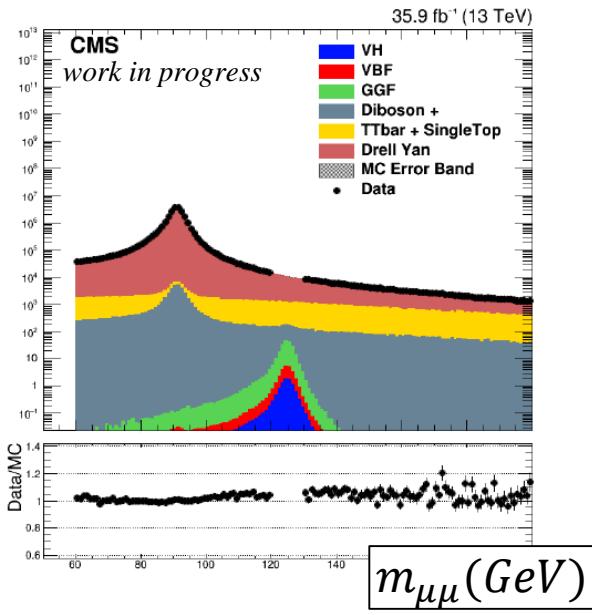

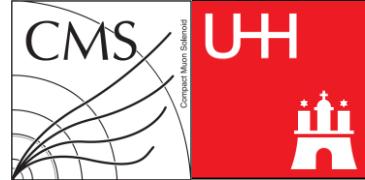

Preselection

- 2 opposite charged muons
- Pt $> 26, 20$ GeV
- Isolated single muon trigger (Pt > 24 GeV)
- Isolated track trigger (Pt > 24 GeV)
- Trigger matching

Corrections

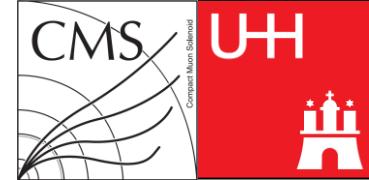

- PileUp reweighting
- Lepton & B-Tag SF from POG
- Muon Momentum Calibration

Object Validation

Event Categorization

PAS HIG-17-019

- small number of expected events
→ categorization
- auto-categorizer algorithm to enhance limits

auto-categorizer method

- maximize gain function
- repeat recursively

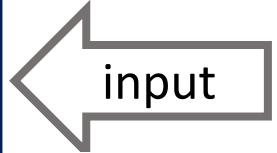

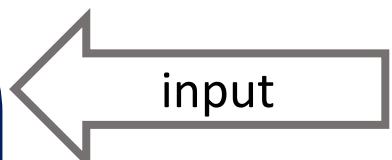

$$\text{GAIN} = \text{SIG}_{\text{NEW1}}^2 + \text{SIG}_{\text{NEW2}}^2 - \text{SIG}_{\text{OLD}}^2$$

SIG_{OLD} Split on var to make
New categories from this category

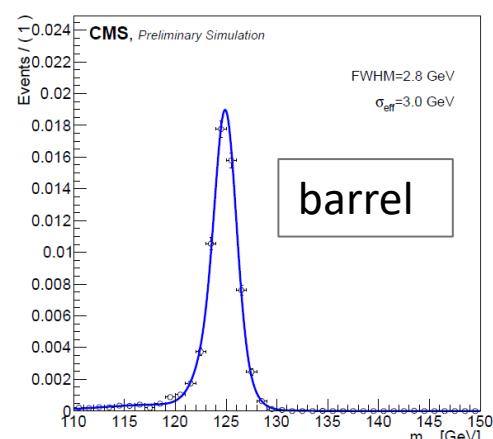

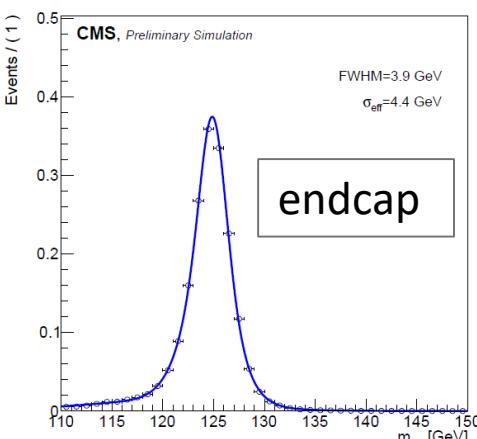

SIG_{NEW1}
New Category 1

SIG_{NEW2}
New Category 2

`var_value < var_cut` `var_value >= var_cut`

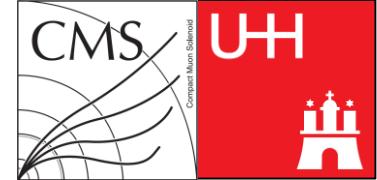

mass resolution max $\eta(\mu_1\mu_2)$

Feature	BDT
Dimuon p_T	
Dimuon η	
$ \delta\phi(\mu\mu) $	
Number of medium b-tags	
$\eta(\text{jet1})$	
E_T^{miss}	
Number of forward jets	
$ \delta\eta(jj_1) $	
Number of central jets	
$\eta(\text{jet2})$	
$ \delta\eta(\mu\mu) $	
$M(jj_1)$	
$ \delta\eta(jj_2) $	
$M(jj_2)$	

Event Categorization

PAS HIG-17-019

- small number of expected events
→ categorization
- auto-categorizer algorithm to enhance limits

auto-categorizer method

- maximize gain function
- repeat recursively

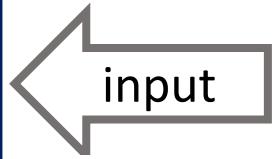

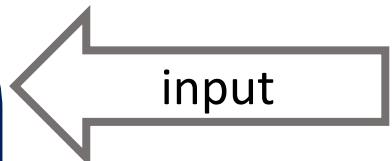

$$GAIN = SIG_{NEW1}^2 + SIG_{NEW2}^2 - SIG_{OLD}^2$$

SIG_{OLD} Split on var to make
New categories from this category

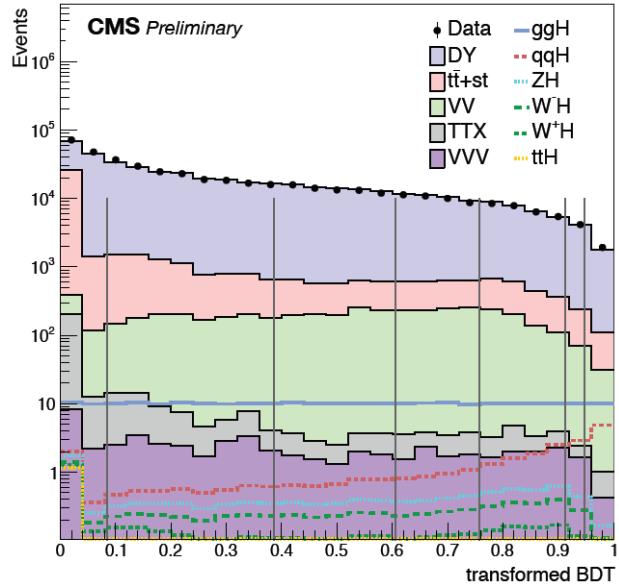

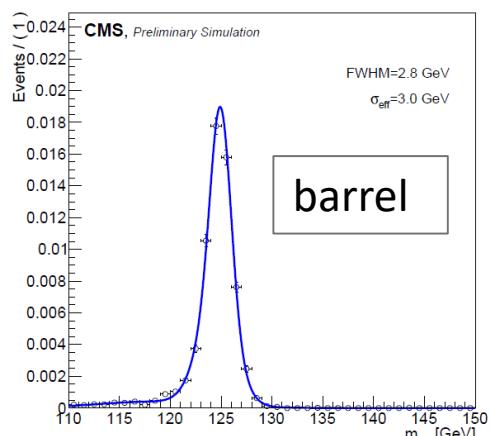

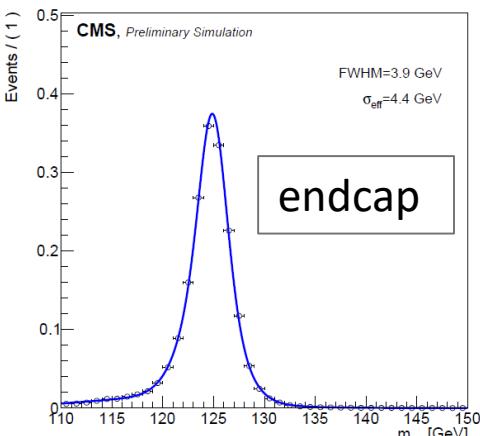

SIG_{NEW1}
New Category 1

SIG_{NEW2}
New Category 2

$var_value < var_cut$ $var_value \geq var_cut$

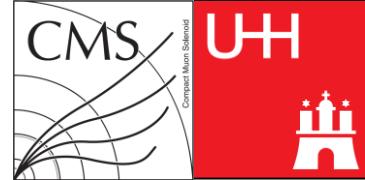

mass resolution max $\eta(\mu_1\mu_2)$

Event Categorization

Results

PAS HIG-17-019

Observed (expected) Limit $\mu < 2.68$ (2.08)

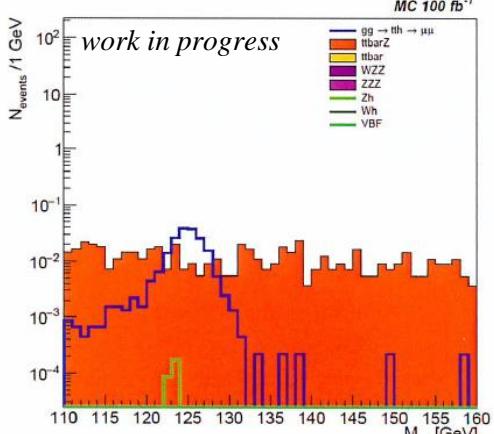

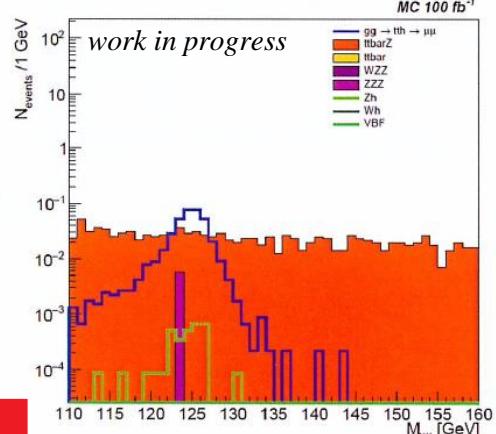

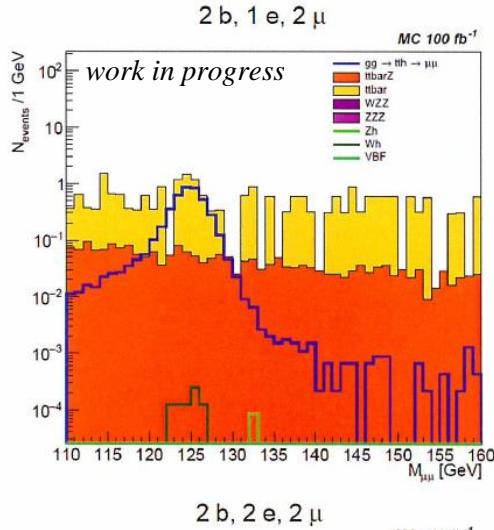

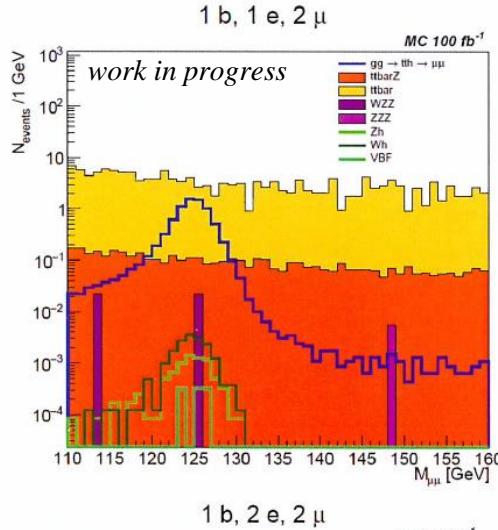

- no excess observed
- limit on signal strength $\mu = \frac{\sigma}{\sigma_{SM}}$

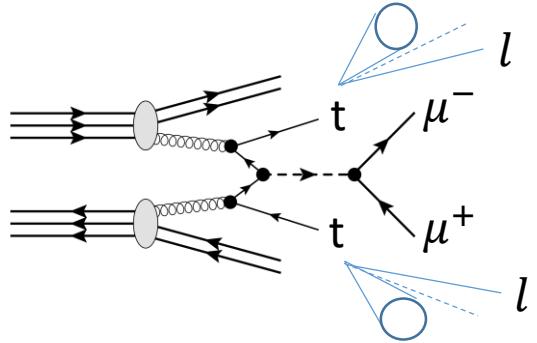

Combination | Observed (expected) Limit $\mu < 2.68$ (1.89) $\rightarrow 0.98\sigma$

Outlook

- test possible improvement by extracting $t\bar{t}h$ events
- optimize analysis tailored to specific kinematics

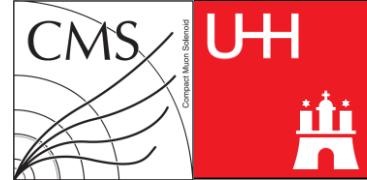

First studies on $t\bar{t}h$ optimized analysis to increase the overall sensitivity

- $L = 100/\text{fb} @ 13 \text{ TeV}$
- analogue selection
- four exclusive categories
- exploited sensitivity of BDT

Conclusion

- analysis concept for the search for dimuon Higgs decays
- two main features:
 - muon momentum calibration
 - auto event categorization
- results for run2 (13 TeV, 2016) with $L = 35.9/\text{fb}$ and combination
 - run2 | $\mu < 2.68$ (2.08)
 - combination | $\mu < 2.68$ (1.98)
