

Higgs and alternatives

Alex Pomarol (Univ. Autònoma Barcelona)

Part of the enormous success of particle physics in the last 50 years has grounded in **gauge theories**

Impressive **calculability**

e.g. **QED**: $\alpha = 0.0072973525693$

Gauge theories have allowed to explain the properties of the **particle zoo**

at 2010:

interactions dictated by a **gauge theory**
based on the $SU(3) \times SU(2) \times U(1)$ symmetry....

Gauge theories have allowed to explain the properties of the **particle zoo**

at 2010:

interactions dictated by a **gauge theory**
based on the $SU(3) \times SU(2) \times U(1)$ symmetry....

Up to mass terms!

Don't respect the $SU(2) \times U(1)$ symmetries

Gauge theories have allowed to explain the properties of the **particle zoo**:

at 2010:

interactions dictated by a **gauge theory** based on the $SU(3) \times SU(2) \times U(1)$ symmetry....

Massive W and Z have 3 polarizations:
New physical states: W_L, Z_L

These new states W_L, Z_L (that must be present even if the masses were tiny) **spoil** the nice properties of gauge theories

Calculability is lost!

a)

$$\propto \frac{s}{v^2}$$

Unitarity is lost at high-energies

Loops are not finite!

Do not allow for precision calculations as in QED

There is a **missing ingredient**
in the **observed** particle content

To find this **missing piece (or pieces)** in the
particle zoo is the **main mission** of the LHC !

What this **missing piece(s)** could be?

Simple Option:

Blame it on the vacuum

Simple Option:

Blame it on the vacuum

Not invariant under
the EW symmetry

Simple Option:

Blame it on the vacuum

EW Symmetry restoration

Not invariant under
the EW symmetry

The theory, before set
in its minimum,
was $SU(2) \times U(1)$ symmetric

Simple Option:

Blame it on the vacuum

EW Symmetry restoration

Not invariant under the EW symmetry

The theory, before set in its minimum, was $SU(2) \times U(1)$ symmetric

Gauge symmetry restoration possible if an extra scalar is present

Simple Option:

Blame it on the vacuum

EW Symmetry restoration

Not invariant under the EW symmetry

The theory, before set in its minimum, was $SU(2) \times U(1)$ symmetric

Gauge symmetry restoration possible if an extra scalar is present = the **Higgs boson**

Completes the SM:

Simple Option:

Blame it on the vacuum

EW Symmetry restoration

Not invariant under the EW symmetry

The theory, before set in its minimum, was $SU(2) \times U(1)$ symmetric

Gauge symmetry restoration possible if an extra scalar is present = the **Higgs boson**

Completes the SM:

(or, more fair, the

Hagen-Englert-Guralnik-Higgs-Brout-Kibble boson

according to Wikipedia and Sakurai-Prize committee

The Higgs is a very special scalar:

Likes to couple to heavy particles:

A Feynman diagram showing a Higgs boson (h) represented by a dashed line on the left. It connects to a loop of W or Z bosons, represented by two wavy lines. The top and bottom of the loop are labeled 'W, Z'. To the right of the loop is an equals sign followed by the expression gM_W and a comma with the fraction $\frac{gM_Z}{\cos \theta_W}$.

$$h \text{ --- } \text{loop} = gM_W, \frac{gM_Z}{\cos \theta_W}$$

A Feynman diagram showing a Higgs boson (h) represented by a dashed line on the left. It splits into two solid lines representing a fermion (f) and an antifermion (f-bar). To the right of the split is an equals sign followed by the fraction $\frac{gM_f}{2M_W}$.

$$h \text{ --- } \text{split} = \frac{gM_f}{2M_W}$$

At tree-level the couplings must be **exactly** this ones
to make the SM a **consistent** theory

Otherwise is **NOT** the Higgs = “**Impostor**”

With the Higgs **calculability** is recovered:

Back to the prediction era!

Only one unknown parameter:
The Higgs mass

Only one unknown parameter: **The Higgs mass**

a) Theoretical bounds:

If we want the SM to be a theory valid up to the Planck scale:

J.Ellis et al

Only one unknown parameter:
The Higgs mass

b) Experimental bounds:

LEP searches + EW Precision Tests

$114 \text{ GeV} < M_h < 157 \text{ GeV}$ (95%CL)

Higgs hunting at the LHC

A precise theory, gives a precise prediction
for Higgs physics at the LHC

Higgs BR

Small uncertainties in present calculations: $< 5\%$

Fig. 1: Total cross sections for Higgs production at the LHC. The gluon fusion result is NNLO QCD with soft gluon resummation effects included at NNLL and uses MRST2002 PDFs with renormalization/factorization scales equal to m_h . The vector boson fusion curve is shown at NLO QCD with CTEQ6M PDFs and renormalization/factorization scales equal to m_h . The Vh results ($V = W, Z$) include NNLO QCD corrections and NLO EW corrections and use MRST2002 PDFs with the renormalization /factorization scales equal to the $m_h - M_V$ invariant mass. The $b\bar{b} \rightarrow h$ result is NNLO QCD, with MRST2002 PDFs, renormalization scale equal to m_h and factorization scale equal to $m_h/4$. The results for $t\bar{t}h$ production are NLO QCD, use CTEQ6M PDFs and set the renormalization/factorization scale to $m_t + m_h/2$ [100].

Fig. 1: Total cross sections for Higgs production at the LHC. The gluon fusion result is NNLO QCD with soft gluon resummation effects included at NNLL and uses MRST2002 PDFs with renormalization/factorization scales equal to m_h . The vector

Uncertainties < 15% from strong corrections

The Vh results (V boson fusion) are NNLO QCD, use CTEQ6M PDFs and set the renormalization/factorization scale to $m_t + m_h/2$ [100].

Best scenario:

Production from **color** particles

+ Decay to **colorless** states:

ATLAS (talk at Planck10) for $\sqrt{s}=7$ TeV and 1/fb:

“Higgs: 3σ evidence in the mass range 145-180GeV”

... but **full** coverage in the long run

**Is the Higgs a “hunting piece”
worthy enough the LHC cost?**

Is the Higgs a “hunting piece” worthy enough the LHC cost?

Theoretical viewpoint:

There must be more than a single Higgs

Although the SM is consistent, it is not “natural”

In QFT is difficult to keep scalar masses
small as compared to other large scales
($M_h \ll M_P$)

Is the Higgs a “hunting piece” worthy enough the LHC cost?

Theoretical viewpoint:

There must be more than a single Higgs

Although the SM is **consistent**, it is not “**natural**”

In QFT is difficult to keep scalar masses
small as compared to other large scales
($M_h \ll M_P$)

Hierarchy problem!

Example of fine-tuning

Analogy with Superconductivity

EWSB $\Leftrightarrow$ Breaking of $U(1)_{\text{EM}}$

Higgs Model $\Leftrightarrow$ Landau Model $\langle h \rangle = \langle e^- e^- \rangle$

$$V(h) = m^2|h|^2 + \lambda|h|^4$$

Analogy with Superconductivity

EWSB $\Leftrightarrow$ Breaking of $U(1)_{\text{EM}}$

Higgs Model $\Leftrightarrow$ Landau Model $\langle h \rangle = \langle e^- e^- \rangle$

Give Landau Model a
good description
of superconductors?

Analogy with Superconductivity

EWSB $\Leftrightarrow$ Breaking of $U(1)_{\text{EM}}$

Higgs Model $\Leftrightarrow$ Landau Model $\langle h \rangle = \langle e^- e^- \rangle$

Give Landau Model a good description of superconductors?

NO, it only works close to the critical line

only there $\langle h \rangle$ is small and it makes sense to Taylor-expand the potential:

$$V(h) = m^2 |h|^2 + \lambda |h|^4 + \dots$$

Possibilities that theorists envisage to tackle the Hierarchy Problem:

- 1) **Supersymmetry**: Stabilize the Higgs potential
- 2) The Higgs is not elementary: **Composite Higgs**

As in superconductivity: $h \sim ee$

or QCD: pions $\sim q\bar{q}$

➡ Both implies **changes** in the Higgs sector

Supersymmetry = MSSM

Supersymmetry = MSSM

Brings Predictions:

1) **Extra** doublet needed: $h + H, A, H^+$

Supersymmetry = MSSM

Brings Predictions:

1) **Extra** doublet needed: $\underbrace{h + H, A, H^+}_{\text{Both play the role of the SM Higgs}}$

Both play the role of the SM Higgs

Supersymmetry = MSSM

Brings Predictions:

1) **Extra** doublet needed: $\underbrace{h + H, A, H^+}_{\text{Both play the role of the SM Higgs}}$

2) One Higgs, h , always **light**: $M_h \lesssim 130 \text{ GeV}$

Good: Since EWPT favors a light Higgs

Bad: Since LEP Higgs bounds rule out a big chunk of the MSSM parameter space ($\sim 90\%$ or more)

MSSM Higgs hunting at the LHC

Bad news: h too light to decay to WW/ZZ

A, H^+ have very small couplings to VV

H small regions with sizable
couplings to WW/ZZ

Good news: Regions where the decays of H, A, H^+ to
leptons are enhanced (Large $\tan\beta$ region)

Near future:

In the long run....

Composite Higgs

Composite Higgs

Two attitudes:

Positive: We already have examples like this in nature:

$$\text{QCD: } m_\pi \ll M_P$$

Negative: Not again **strong dynamics!**
calculations are difficult

Composite Higgs

Two attitudes:

Positive: We already have examples like this in nature:

$$\text{QCD: } m_\pi \ll M_P$$

calculations are difficult

Picture from
G.F. de Teramond

“Sexier” approach to
composite Higgs:

Higgs as an “hologram”

Contino, Nomura, AP 03

The 4D compositeness
properties of the Higgs are
due to its 5D nature

(AdS/CFT correspondence)

Maldacena 98

Composite Higgs scenario is inspired by QCD where one observes that the (pseudo) scalar are the lightest states

Kaplan, Georgi '80

QCD spectrum:

Are Pseudo-Goldstone
bosons (PGB)

Mass protected by
global symmetries in QCD!

Spectrum of the new QCD-like sector:

Kaplan, Georgi '80

Similar but slightly different approach: **Little Higgs**

Arkani-Hamed, Cohen, Georgi

How to unravel the **composite** nature of the Higgs?

Easy in an **ideal** collider:

As we do it with pions in QCD:

How to unravel the **composite** nature of the Higgs?

Easy in an **ideal** collider:

Similarly for the Higgs:

How to unravel the **composite** nature of the Higgs?

But in a **real** collider (LHC):

Only access up to few TeV

How to unravel the **composite** nature of the Higgs?

But in a **real** collider (LHC):

Only access up to few TeV

$\mathcal{F}_h(p)$

Elementary state

Composite state

p

Can we see
deviations of
the Higgs
couplings?

Parametrization of deviations from SM Higgs couplings

Contino et al 10

$$\mathcal{L} = \frac{M_V^2}{2} V_\mu^2 \left(1 + 2a \frac{h}{v} + b \frac{h^2}{v^2} \right) - m_f \bar{\psi}_L \psi_R \left(1 + c \frac{h}{v} \right) + \dots$$

SM Higgs: $a = b = c = 1$

Composite Higgs:

Giudice, Grojean, AP, Rattazzi 07

$$a = \sqrt{1 - \frac{v^2}{f^2}} \quad b = 1 - \frac{2v^2}{f^2} \quad c = \sqrt{1 - \frac{v^2}{f^2}}$$

Scale related to the composite-scale

Since its couplings are different, it's **NOT** a true Higgs

Composite Higgs only partly does the job of a **true** Higgs

Composite Higgs only partly does the job of a **true** Higgs

Extra states needed to
fully unitarize (for consistency)!

Composite Higgs only partly does the job of a **true** Higgs

Extra states needed to
fully unitarize (for consistency)!

Extra resonances
(or Kaluza-Klein states of the W)

$$M_{\text{KK}} \lesssim \frac{2 \text{ TeV}}{\sqrt{1 - a^2}}$$

Composite Higgs only partly does the job of a **true** Higgs

Extra states needed to
fully unitarize (for consistency)!

Extra resonances
(or Kaluza-Klein states of the W)

In the limit $a=0$ (**~ Higgsless**)
KK do all the job!

$$M_{\text{KK}} \lesssim \frac{2 \text{ TeV}}{\sqrt{1 - a^2}}$$

Maximal degree of compositeness not allowed by EWPT

$$\Rightarrow a > 0.86$$

Put a bound on the scale of compositeness: $f > 500 \text{ GeV}$

Higgsless ($a=0$) disfavored

Of course, extra contributions can make $a \sim 0$ case
consistent with EWPT

EXAMPLE: Extra state **Dilaton**

Goldberger, Grinstein, Skiba 07

(present in certain theories with
spontaneous breaking of scale invariance)

Higgs-like state with:

$$a = \sqrt{b} = c = \frac{v}{f_D} \sim \mathcal{O}(1) \quad \text{Helps for EWPT}$$

Acts like a Higgs but has nothing to do with EWSB

The most serious Higgs impostor!

If the Higgs is **composite**,
how it will change LHC predictions?

Bad news: Reduction of rates!

Giudice, Grojean, AP, Rattazzi 07

Duhrssen 03

Higgs coupling measurements $\sim 20\text{-}40\%$

recent studies Lafaye, Plehn, Rauch, Zerwas, Duhrssen 09

ILC would be a perfect machine to test these scenarios:
 effects could be measured up to a few %

Genuine properties of the **composite** nature of the Higgs

- 1) $W_L W_L$ -scattering grows at high energy
- 2) Double-Higgs production grows at high energy

Contino et al 10

In the best cases “ 3σ signal significance with 300/fb collected at a 14 TeV LHC”

Genuine properties of the **composite** nature of the Higgs

- 1) $W_L W_L$ -scattering grows at high energy
- 2) Double-Higgs production grows at high energy

Contino et al 10

$$pp \rightarrow hhjj \rightarrow 4Wjj \rightarrow \begin{cases} l^+ l^+ l^- l^- \cancel{E}_T + 2j \\ l^+ l^- l^\pm \cancel{E}_T + 4j \\ l^{+(-)} l^{+(-)} \cancel{E}_T + 5j (6j) \end{cases}$$

In the best cases “ 3σ signal significance with 300/fb collected at a 14 TeV LHC”

Distinguishing a SM Higgs, a composite Higgs and a dilaton

Contino et al 10

$$H_T = \sum_{i=1,2} |p_{TH_i}|$$

The **composite Higgs** can have PGB companions

Gripaios, AP, Riva, Serra

In certain models: One Higgs doublet (**h**) + Singlet (**η**)

Possibility for a new Higgs decay:

$$h \rightarrow \eta\eta \rightarrow b\bar{b}b\bar{b} \text{ or } \tau\bar{\tau}\tau\bar{\tau} \quad (\text{depending on the } \eta\text{-mass})$$

Similar signatures in non-minimal Susy Higgs models

Dermisek, Gunion

Conclusions

LHC **must** (and will) find the **missing piece(s)** of the SM

Conclusions

When a **Higgs-like** state is found, it will be crucial to determine its role in EWSB

e.g. where it **sits** in this plane!

Conclusions

When a **Higgs-like** state is found, it will be crucial to determine its role in EWSB

e.g. where it **sits** in this plane!

A rough perspective of different theoretical scenarios:
