# Overview of the calculation

## Non-thermal nucleosynthesis

$$\frac{dY_X}{dt} \sim \sum_N \pm Y_N \int_0^\infty dE f_\gamma \sigma_{\gamma+N \rightarrow X}$$

# Upper limits on the abundance ('large' masses)

- BBN bounds are sensitive to three different effects
  - A combined analysis is seemingly relevant

# Upper limits on the abundance ('large' masses)

$$\tau_\phi \lesssim 200 \text{ s}$$

- Modified Hubble rate causes modified time-temp. relation → base effect

# Upper limits on the abundance ('large' masses)

$$200 \text{ s} \lesssim \tau_\phi \lesssim 10^4 \text{ s}$$

- Decay of  $\phi$  leads to entropy injection into the thermal bath

$$\eta \sim n_b/s, \quad \eta_{\text{pre-decay}} \geq 6.1 \times 10^{-10} = \eta_{\text{CMB}}$$

# Upper limits on the abundance ('large' masses)

$$200 \text{ s} \lesssim \tau_\phi \lesssim 10^4 \text{ s}$$

- Decay of  $\phi$  leads to entropy injection into the thermal bath

$$\eta \sim n_b/s, \quad \eta_{\text{pre-decay}} \geq 6.1 \times 10^{-10} = \eta_{\text{CMB}}$$

- Vanishes for smaller lifetimes: *deuterium bottleneck*

# Upper limits on the abundance ('large' masses)

$$\tau_\phi \gtrsim 10^4 \text{ s}$$

- Photodis. causes underproduction of D and/or overproduction of  $^3\text{He}$
- $\text{D}(\gamma, n)p \leftarrow \uparrow$ 
 $^4\text{He}(\gamma, n)^3\text{He} \leftarrow \uparrow$

# Upper limits on the abundance ('large' masses)

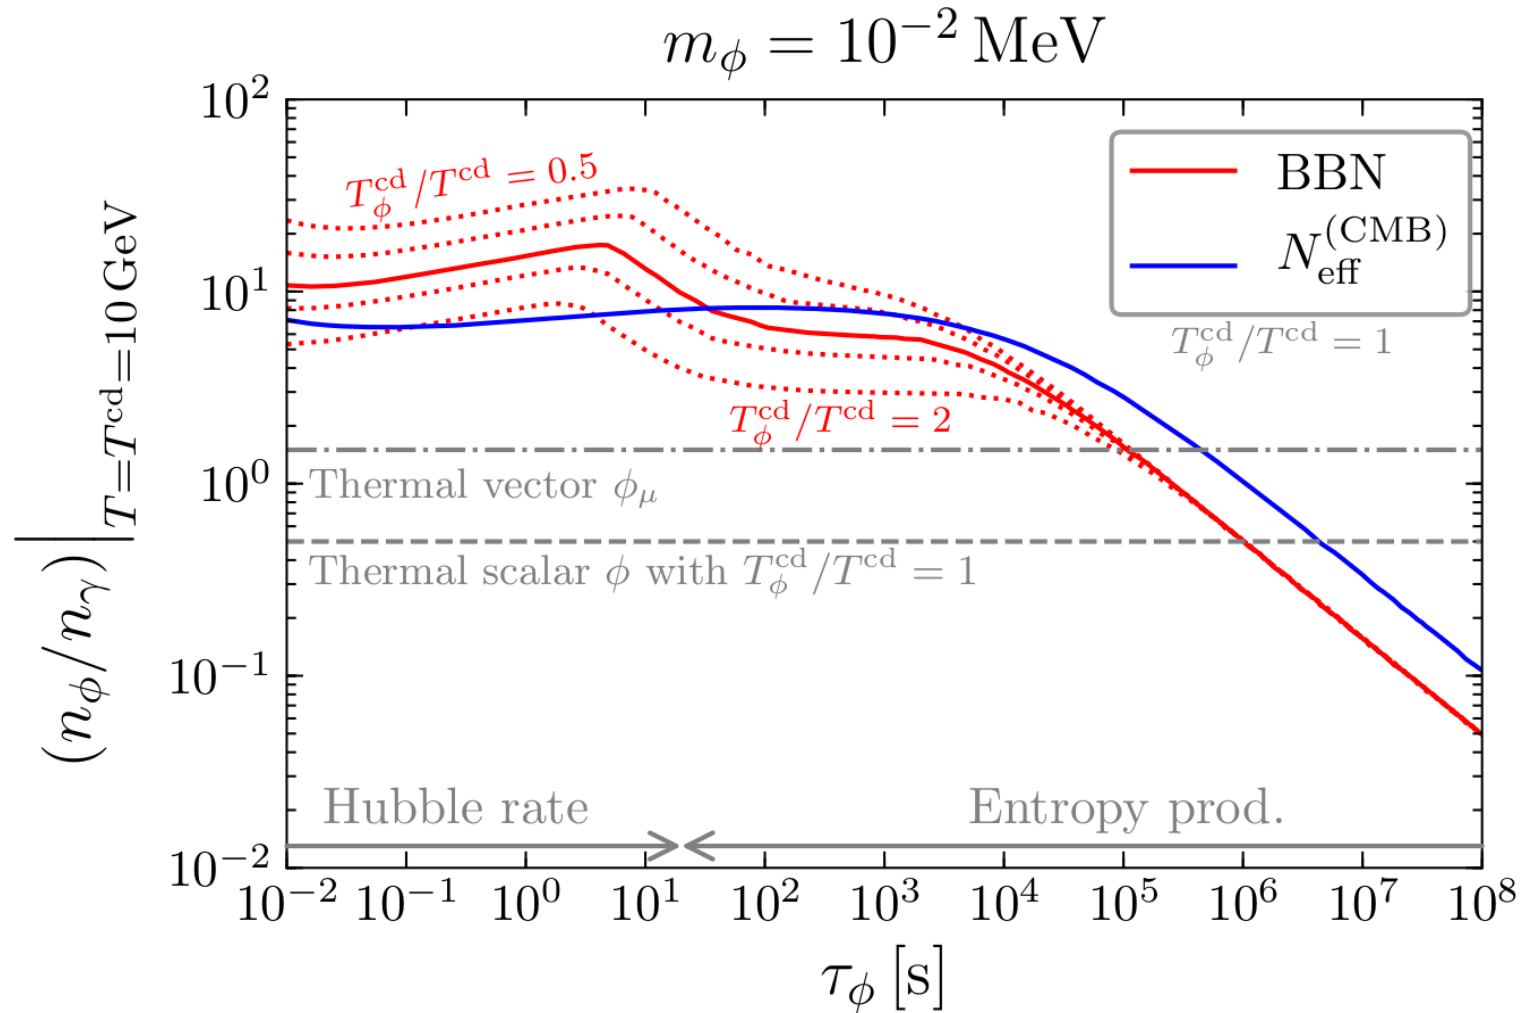

$$\tau_\phi \gtrsim 10^4 \text{ s}$$

- Photodis. causes underproduction of D and/or overproduction of  ${}^3\text{He}$   
 $\text{D}(\gamma, n)p \leftarrow \uparrow \quad \quad \quad {}^4\text{He}(\gamma, n){}^3\text{He} \leftarrow \uparrow$

- Vanishes for smaller lifetimes: Injection energy below *deuterium threshold*

# Upper limits on the abundance (smaller masses)

- $m_\phi$  below *deuterium threshold* → photodisintegration irrelevant

# Upper limits on the abundance (smaller masses)

- For relativistic particles  $\rho_\phi \propto n_\phi$  : Dependence on  $T_\phi^{\text{cd}}/T^{\text{cd}}$   
 → Stronger bounds for hotter dark sectors

# Upper limits on the abundance (smaller masses)

- Lorentz boost extends entropy constraint down to

$$\tau_\phi \sim 20 \text{ s} \quad \leftrightarrow \quad t_{\text{decay}} \sim 200 \text{ s}$$

# Results for a thermal scalar

- The bounds significantly differ from the naive estimates in large parts of the parameter space

$$0.3 \text{ s} \lesssim \tau_\phi \lesssim 10^8 \text{ s}$$

# Conclusions

---

- For the first time, we present a comprehensive study on electromagnetically decaying MeV-scale particles

# Conclusions

---

- For the first time, we present a comprehensive study on electromagnetically decaying MeV-scale particles
- Depending on the region of parameter space either of the effects is relevant  
→ Necessity of a dedicated study for MeV-scale particles

# Conclusions

---

- For the first time, we present a comprehensive study on electromagnetically decaying MeV-scale particles
- Depending on the region of parameter space either of the effects is relevant  
→ Necessity of a dedicated study for MeV-scale particles
- We find large deviations from the generic order-of-magnitude estimates

$$\tau_\phi \lesssim 1 \text{ s} \qquad \tau_\phi \lesssim 10^4 \text{ s}$$

# Conclusions

- For the first time, we present a comprehensive study on electromagnetically decaying MeV-scale particles
- Depending on the region of parameter space either of the effects is relevant  
→ Necessity of a dedicated study for MeV-scale particles
- We find large deviations from the generic order-of-magnitude estimates

$$\tau_\phi \lesssim 1\text{ s} \quad \tau_\phi \lesssim 10^4\text{ s}$$

$$0.3\text{ s} \lesssim \tau_\phi \lesssim 10^8\text{ s}$$

→ Strongly depends on the region of parameter space

Thank you for  
your attention!
