

## Saeed Karamooz - MicroTCA growth

*Wednesday 5 December 2018 11:00 (30 minutes)*

MicroTCA continues to develop and to be adopted worldwide across a huge range of applications. While some early adopters dropped out of the market, impacting vendor choice, those that remained have seen significant growth. Increased capability, in part driven by enhancements such as MTCA.4 and MTCA.4.1, has allowed MicroTCA to address markets far from its initial roots in telecommunication. A brief sampling of successful deployments shows the architecture to be far more flexible - and certainly more widely used - than many in the industry recognise. The standard represents a highly profitable business opportunity for embedded computer manufacturers, and forthcoming speed and power improvements will enhance capability further and drive growth.
