

Linear system in LArTPC 3D image reconstruction

Monday 16 September 2019 14:55 (20 minutes)

A liquid argon TPC can be viewed as a linear system where signals of ionization electrons are transformed into measurements of charges on each sensor in a linear and time-invariant fashion. This view allowed us to treat the entire system with linear equations in terms of signal processing and 3D image reconstruction. Techniques used in the Wire-Cell software package will be presented.

Presenter: Dr ZHANG, Chao (Brookhaven National Laboratory)

Session Classification: Talks
