Vertex Resolution studies on Generated Level

Vinaya Krishnan, Diwakar, Merijn van de Klundert,Andrea Cardini, Arun Kumar Nayak.

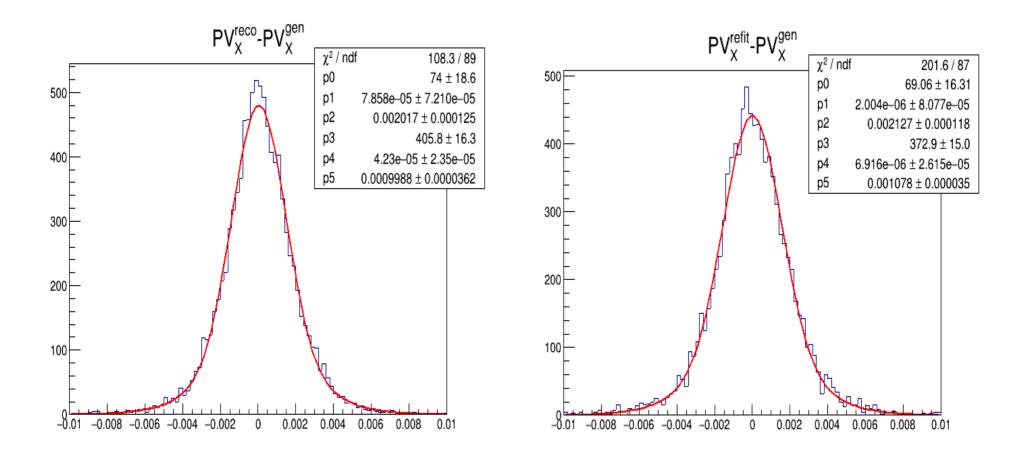

Procedure

- Considering $H \rightarrow \tau \tau$ process, find the tau pair which orginated from Higgs. Such that **generated vertex** will be Higgs production vertex.
- Each tau leg undergoes decay, generated decay products match with the reconstructed particle by using $\Delta R > 0.4$
- The indices of generated particle which are matched are used to find the correct **refitted vertex**.

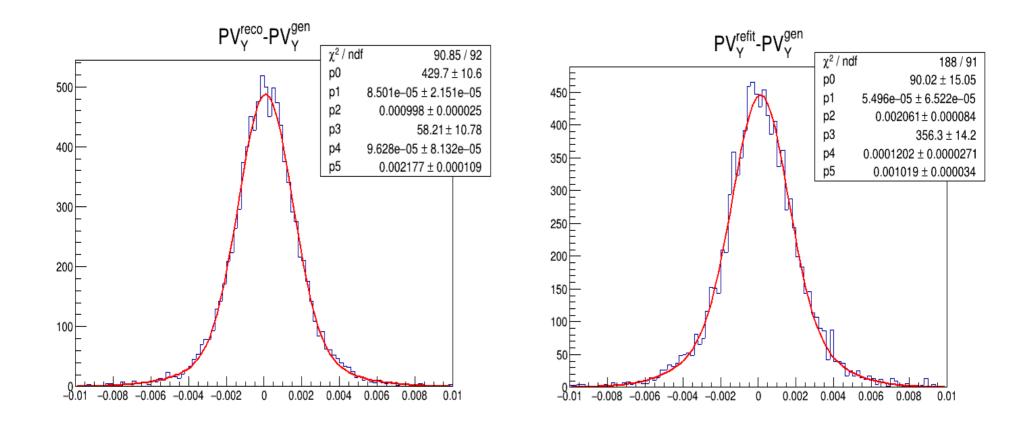

Vertex calculation using SyncNtuple

- In SyncNtuple the generated Higgs Vertex is already stored.
- We considering the process $H \rightarrow \mu(\tau)\tau$. the selection of muon and tau are already implied in SyncNtuple.
- We used the muon indices and tau indices for calculating correct refitted vertex.

Summary

- In VBF sample around 30% of events are not refitted. In ggH sample it becomes 40%.
- But by using SynchNtuple, only 7 out of 500 number of events are not refitted.
- The refitting is not helpful in VBF sample. But in ggH sample resolution in refitted vertex are slightly good.

Future works

- The huge number of events are not refitted on generated level. We are trying to investigate on it.
- The Kinematics plots of Higgs decay product is asked, I am trying to producing it.
- Diwakar is working to add the impact parameter on Ntuple.
