

Fast Direct-Sampling Digitizer for RF Accelerator Diagnostics

Johannes Zink

Coarse Bunch Arrival Time Monitor (CBAM)

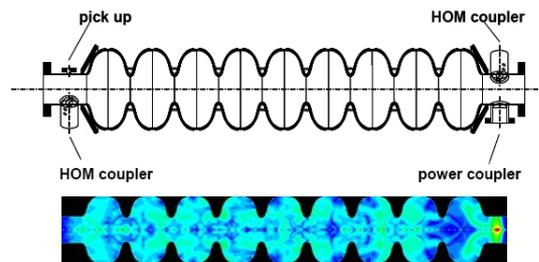

- it is time consuming to set up the high precision BAM system in FLASH or European-XFEL

IDEA:

- a cost optimized direct sampling system which
- roughly estimates the bunch arrival time (\sim ps precision) after the first shots
- estimated arrival time is used to tune the high precision BAM system automatically

Higher Order Mode Sampling (HOM1300)

- higher order modes (wakefields) are induced by the electron beam in accelerating cavities
- unwanted higher frequency energy is removed by two HOM couplers

IDEA:

- sampling of the HOM signals from the couplers
- extract information of cavity alignment or bunch arrival time from HOM signals
