Searches for an exotic decay of the Higgs boson to a pair of pseudoscalars in CMS

Danyer Pérez Adán

On behalf of the CMS collaboration

Outline

- Motivation
- $h(125) \rightarrow a_1 a_1$ searches in CMS at 13 TeV
  - Resolved Topology
    - $h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\mu\mu$
    - $h(125) \rightarrow a_1 a_1 \rightarrow bb\tau\tau$
    - $h(125) \rightarrow a_1 a_1 \rightarrow bb\mu\mu$
  - Boosted Topology
    - $h(125) \rightarrow a_1 a_1 \rightarrow \mu\mu\mu\mu$
    - $h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\tau\tau$
- Summary of the results
- Conclusion

Motivation

The 125 GeV Higgs boson

$$BR_{BSM} < 34\%$$

Combined ATLAS and CMS coupling analysis for the Run1 Data [arXiv:1606.02266]

2HDM

- One of the simplest possible extensions of the SM
- They play an important role in:
  - **Supersymmetry:** *holomorphy and cancellation of anomalies*
  - **Axion models:** *imposing Peccei and Quinn symmetry only possible if there are two Higgs doublets*
  - **Baryon asymmetry:** *it could contain additional sources of CP violation*

However, 2HDMs are by now strongly constrained from existing data

2HDM+S

- The current constraints can be avoided by:
  - assuming that the 2HDM is in the decoupling limit $\alpha \to \beta - \frac{\pi}{2}$
    the couplings of h(125) become SM-like or very close to SM-like
  - adding one complex scalar singlet $S = \frac{1}{\sqrt{2}}(S_R + iS_I)$
    it only couples to $H_{1,2}$ and it is allowed to have small mixing with these

Motivation

Light Pseudoscalar (a_1)

- The 2HDM+S contains 7 physical states:

  2 charged (H^+,H^-), 3 CP-even (h_1,h_2,h_3) and 2 CP-odd (a_1,a_2)

  a_1 is the mostly-singlet-like pseudoscalar $a_1 = cos(\theta_{a_1})S_l + sin(\theta_{a_1})A$ $\qquad \theta_{a_1} \ll 1$

- There exist scenarios in which a_1 is lighter than the SM-like Higgs, namely:

$$m_{a_1} < \frac{m_{h(125)}}{2} \approx 63 \text{ GeV}$$

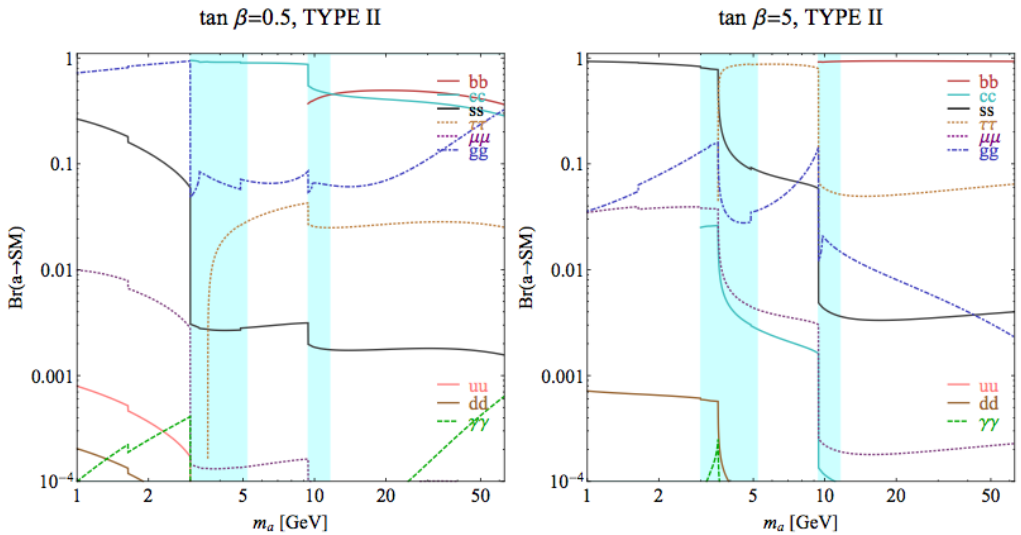
in this case, there are exotic Higgs decays of the form: $h(125) \rightarrow a_1 a_1 \rightarrow X\overline{X}Y\overline{Y}$

Table: Types of fermion couplings (w/o FCNC)

2HDM	u-type	d-type	lepton
Type-I	H_2	H_2	H_2
Type-II	H_2	H_1	H_1
Type-III	H_2	H_2	H_1
Type-IV	H_2	H_1	H_2

$BR(a_1 \rightarrow X\overline{X})$ for Type II

[arXiv:1312.4992]

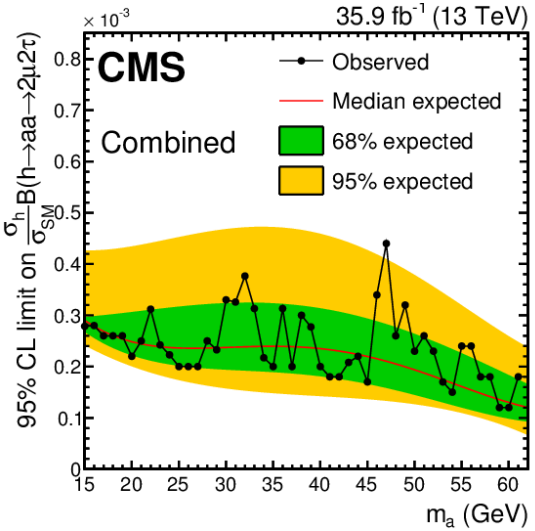


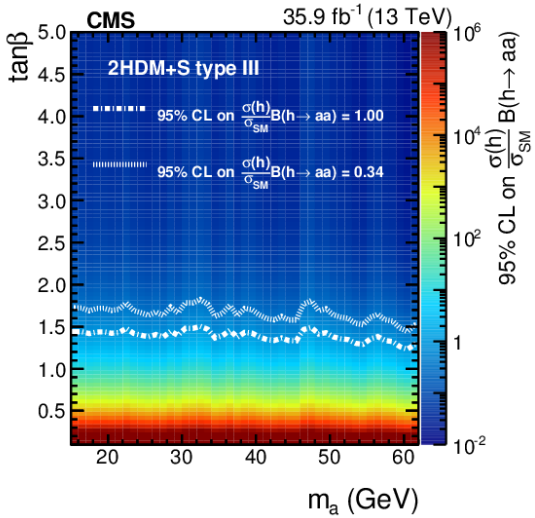
$h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\mu\mu$ [arXiv:1805.04865]

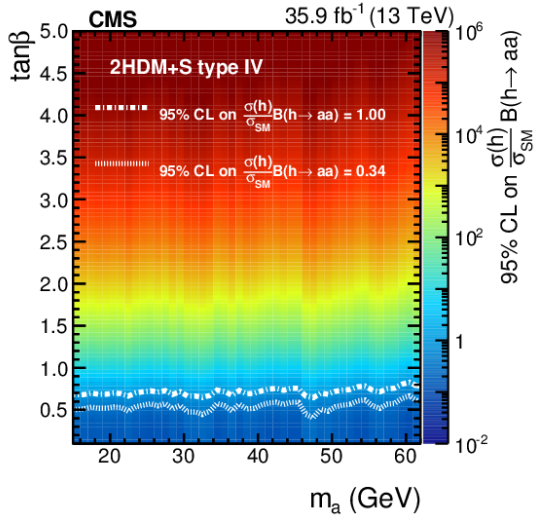
- Mass range probed: $15.0 < m_{a_1} < 62.5$ GeV
- Production modes of h(125) considered: gluon fusion (**ggH**) and vector boson fusion (**VBF**)
- $h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\tau\tau$ events are also treated as part of the signal by means of the relation:

$$\frac{B(a_1 \rightarrow \mu\mu)}{B(a_1 \rightarrow \tau\tau)} = \frac{m_\mu^2 \sqrt{1 - \left(2m_\mu / m_{a_1}\right)^2}}{m_\tau^2 \sqrt{1 - \left(2m_\tau / m_{a_1}\right)^2}} \quad (1)$$

- Four different final states were covered: $\mu\mu + e\mu$, $\mu\mu + e\tau_h$, $\mu\mu + \mu\tau_h$ and $\mu\mu + \tau_h\tau_h$
- Signal extraction: unbinned maximum-likelihood fit based on the $m_{\mu\mu}$ distribution
- The shape and yield of the backgrounds are estimated from data



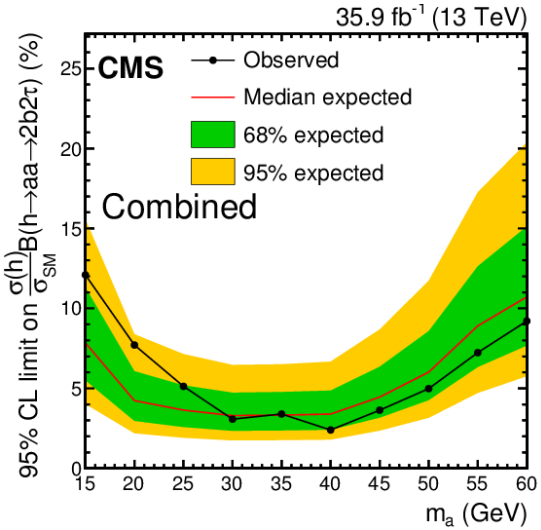


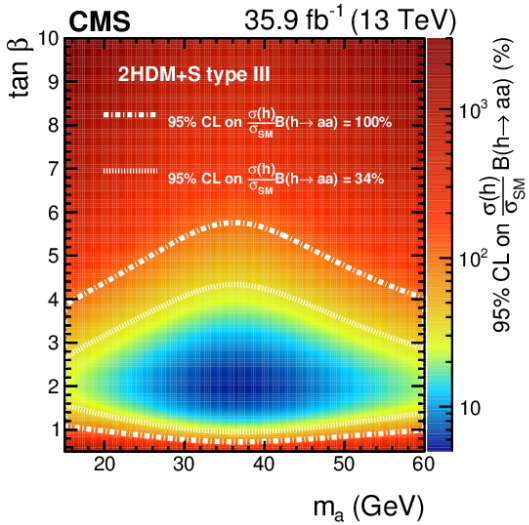


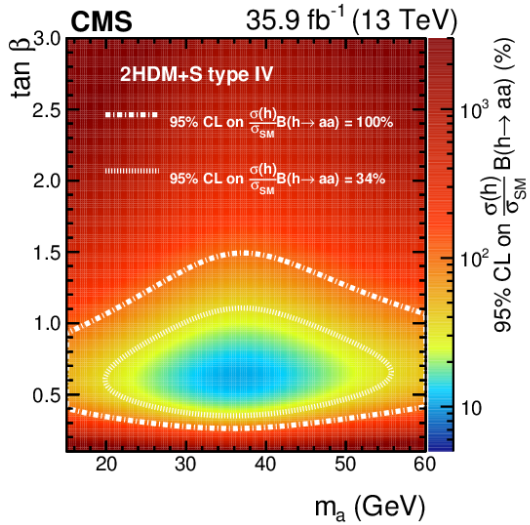
$h(125) \rightarrow a_1 a_1 \rightarrow bb\tau\tau$ [arXiv:1805.10191]

- Mass range probed: $15 < m_{a_1} < 60$ GeV
- Production modes of h(125) considered: **ggH**, **VBF** and associated vector boson (**VH**)
- Three different final states were covered: $b_{tagged \geq 1} + e\mu$, $b_{tagged \geq 1} + e\tau_h$ and $b_{tagged \geq 1} + \mu\tau_h$
- Categorization (4 cats.) according to the variables:

  $m^{vis}_{b\tau\tau}$ $m_T(e(\mu), \overrightarrow{p}^{miss}_T)$ $m_T(\mu(\tau_h), \overrightarrow{p}^{miss}_T)$ D_ζ [*]
- Signal extraction: binned maximum-likelihood fit based on the $m^{vis}_{\tau\tau}$ distribution
- The backgrounds are estimated from a combination of simulation and data







[*] $D_\zeta \equiv \overrightarrow{p}^{miss}_T \cdot \frac{\overrightarrow{\zeta}}{|\overrightarrow{\zeta}|} - 0.85\ (\overrightarrow{p}_{T,1} + \overrightarrow{p}_{T,2}) \cdot \frac{\overrightarrow{\zeta}}{|\overrightarrow{\zeta}|}$ $\overrightarrow{\zeta}$ → bisector of the transverse momenta of the two τ candidates

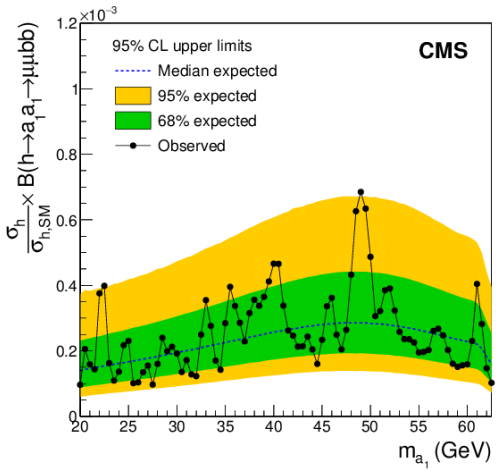
$h(125) \rightarrow a_1 a_1 \rightarrow bb\mu\mu$ [arXiv:1812.06359]

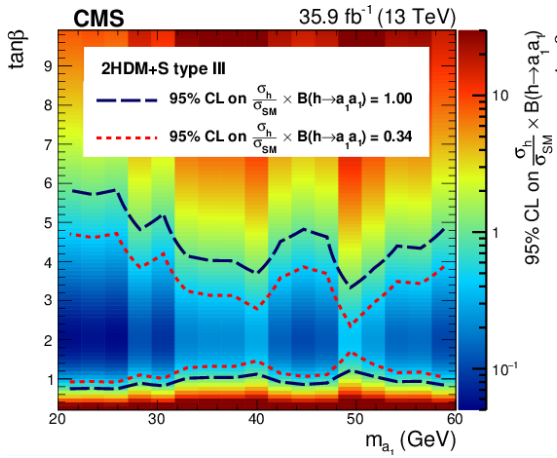
- Mass range probed: $20.0 < m_{a_1} < 62.5$ GeV
- Production modes of h(125) considered: **ggH** and **VBF**
- Final state: $b_{tagged}\, b_{tagged} + \mu\mu$
- Events are selected if they have $\chi^2 < 5$:

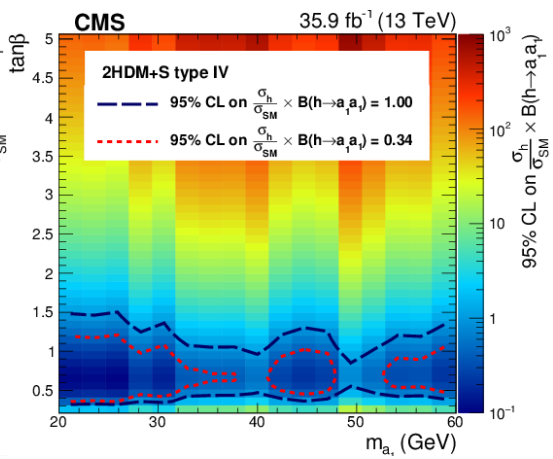
$$\chi^2 = \chi^2_{bb} + \chi^2_h \qquad \chi_{bb} = \frac{m_{bb} - m_{\mu\mu}}{\sigma_{bb}} \qquad \chi_h = \frac{m_{\mu\mu bb} - m_h}{\sigma_h}$$

- Categorization (3 cats.) according to the b tagging discriminator value of one of the jets:

  Tight-Tight Tight-Medium Tight-Loose
- Signal extraction: unbinned maximum-likelihood fit based on the $m_{\mu\mu}$ distribution
- The background estimation fully relies on data by using the discrete profiling method



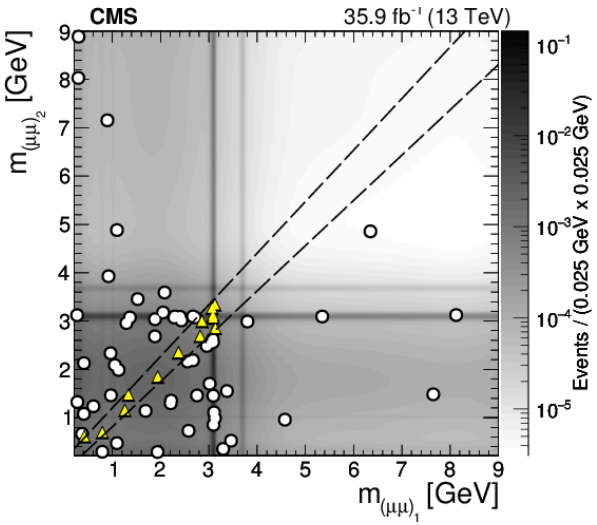


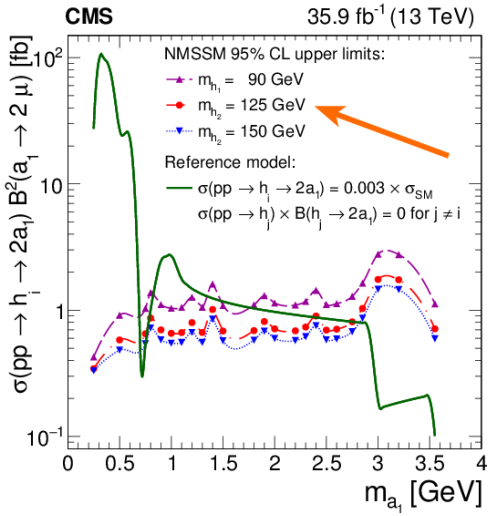


$h(125) \rightarrow a_1 a_1 \rightarrow \mu\mu\mu\mu$ [arXiv:1812.00380]

- Mass range probed: $0.25 < m_{a_1} < 3.55$ GeV
- Production mode of h(125) considered: **ggH**
- Final state: $\mu\mu + \mu\mu$
- Events are selected if they fulfill the relation $m_{(\mu\mu)1} \simeq m_{(\mu\mu)2}$, as shown in the figure
- Signal extraction: unbinned maximum-likelihood fit based on the 2D $m_{(\mu\mu)1}$ vs. $m_{(\mu\mu)2}$ distribution
- The estimation of the main background contribution ($b\bar{b}$) is from data
  - The prompt double J/ψ and electroweak backgrounds are modelled from data and simulation respectively

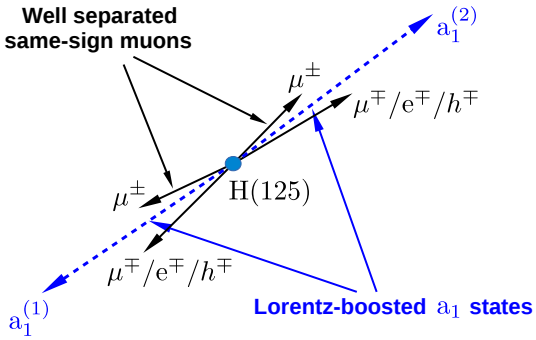
⋆ **Total expected background events:** $9.90 \pm 1.24(stat) \pm 1.84(syst)$ **Observed events:** 13



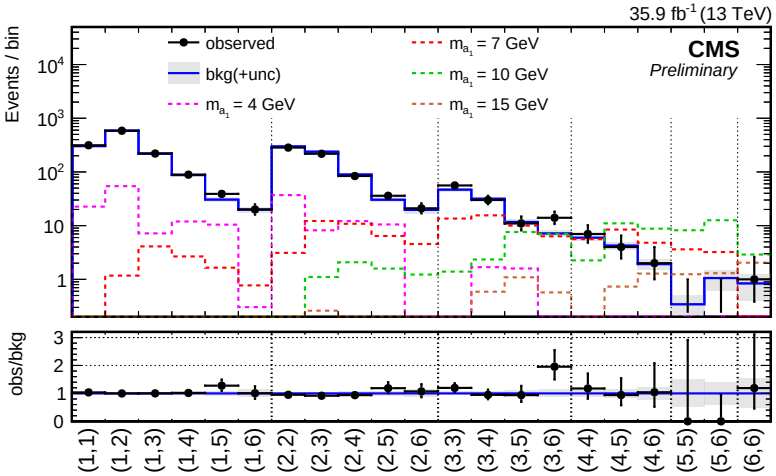


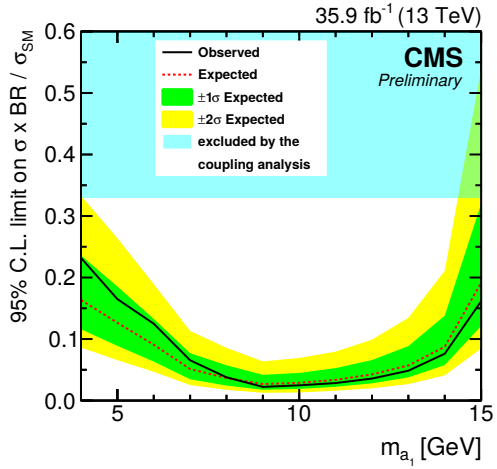
$h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\tau\tau$ **NEW!** [CMS-PAS-HIG-18-006]

- Mass range probed: $4 < m_{a_1} < 15$ GeV
- Production mode of h(125) considered: **ggH**, **VBF**, **VH** and top quark pair associated production (**ttH**)
- $h(125) \rightarrow a_1 a_1 \rightarrow \mu\mu\tau\tau$ events are also included as part of the signal by using Eq. 1
- Final state covered: $\mu^{\pm}\tau^{\mp}_{one-prong} + \mu^{\pm}\tau^{\mp}_{one-prong}$ **(See sketch)**
- Events are selected if they have exactly two isolated $\mu^{\pm} - trk^{\mp}$ pairs within a cone of size $\Delta R = 0.5$

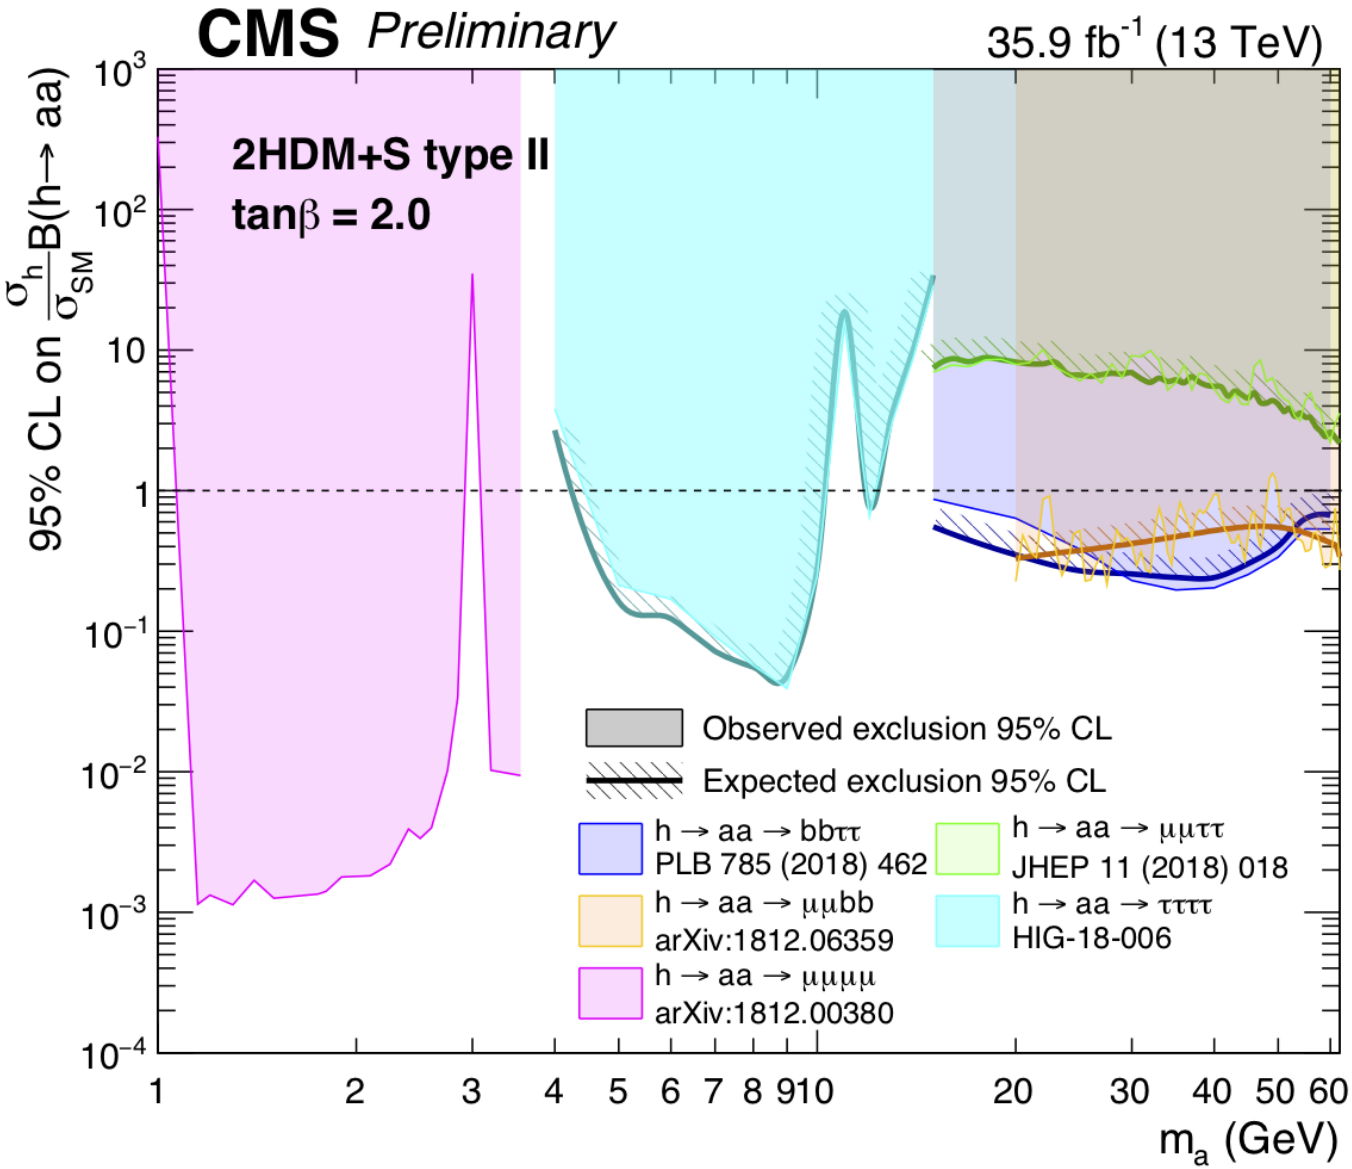


- Signal extraction: binned maximum-likelihood fit based on the 2D $m_{(\mu-trk)1}$ vs. $m_{(\mu-trk)2}$ distribution
- The background modelling is based on data, although some auxiliary tests also include simulation





Summary of the results



Conclusion

...

- Many $h(125) \rightarrow a_1 a_1$ searches performed in different decay channels and final states
- The searches cover a large variety of 2HDM+S models
  - Almost all possible masses for the a_1 boson have been probed, having to deal with different boosted regimes
  - Scenarios comprising all types of fermion coupling have been tested
- No sign of $h(125) \rightarrow a_1 a_1$ decay yet ...
- Limits are becoming more stringent as more data is added
- Other interesting analyses ongoing:
  - $h(125) \rightarrow a_1 a_1 \rightarrow bbbb$ (first time in CMS)
  - $h(125) \rightarrow a_1 a_1 \rightarrow \tau\tau\mu\mu$ (for light a_1 masses)

Conclusion
