

A New Collider to Unravel the Mysteries of the Universe

Wednesday 20 November 2019 12:45 (5 minutes)

Future lepton colliders, like the International Linear Collider (ILC), will complement the potential of the LHC by performing high-precision measurements of the Standard Model of particle physics and searches for new particles. The physics programme of the ILC covers a broad range of aspects, like high-precision measurements of the properties of the Higgs boson and the top quark and tests for beyond the Standard Model physics.
