

Updates on inclusive charm cross section

N. Z. Jomhari, A. Geiser

DESY Hamburg
QCD meeting

Dec 06, 2019

Recap

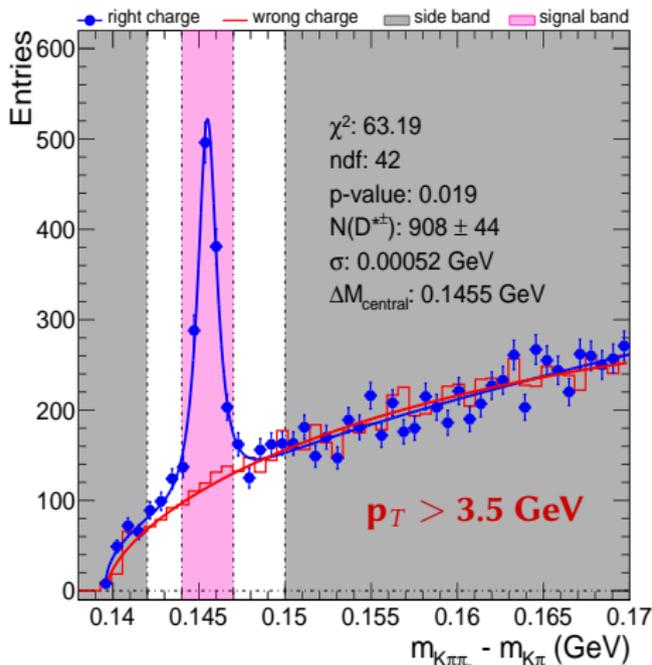

- **Objective:** To measure the total cross section of inclusive charm at different pp center of mass energies (0.9, 2.7, 5, 7, 8, 13 (from PU in BParking) TeV)
- **How?:** By using all PV in the event. More details can be found in backup
- **Today (7 TeV):**
 - Determination of N_{signal} and fitting D^* mass distribution
 - Detector Efficiency
 - Luminosity
 - First look at the cross section of D^*

Steps towards cross section

$$\sigma = \frac{N}{L_{int} \cdot \epsilon \cdot a}$$

Nsignal in higher p_T region

SF: 1.09, Nsignal = 908 ± 44

Nsignal

- Normalized the wrong charge (WC) sign to the right charge sign in the side bands to get the scale factor (SF)
- Use the SF to normalize WC sign in signal band
- Subtract right charge sign to the normalized wrong charge to get Nsignal

Modified gaussian function for signal

$$\text{Gauss}^{\text{mod}} \propto \exp[-0.5 \cdot x^{1+1/(1+0.5 \cdot x)}]$$

$$x = |(\Delta m - m_0)/\sigma|$$

Threshold function for background

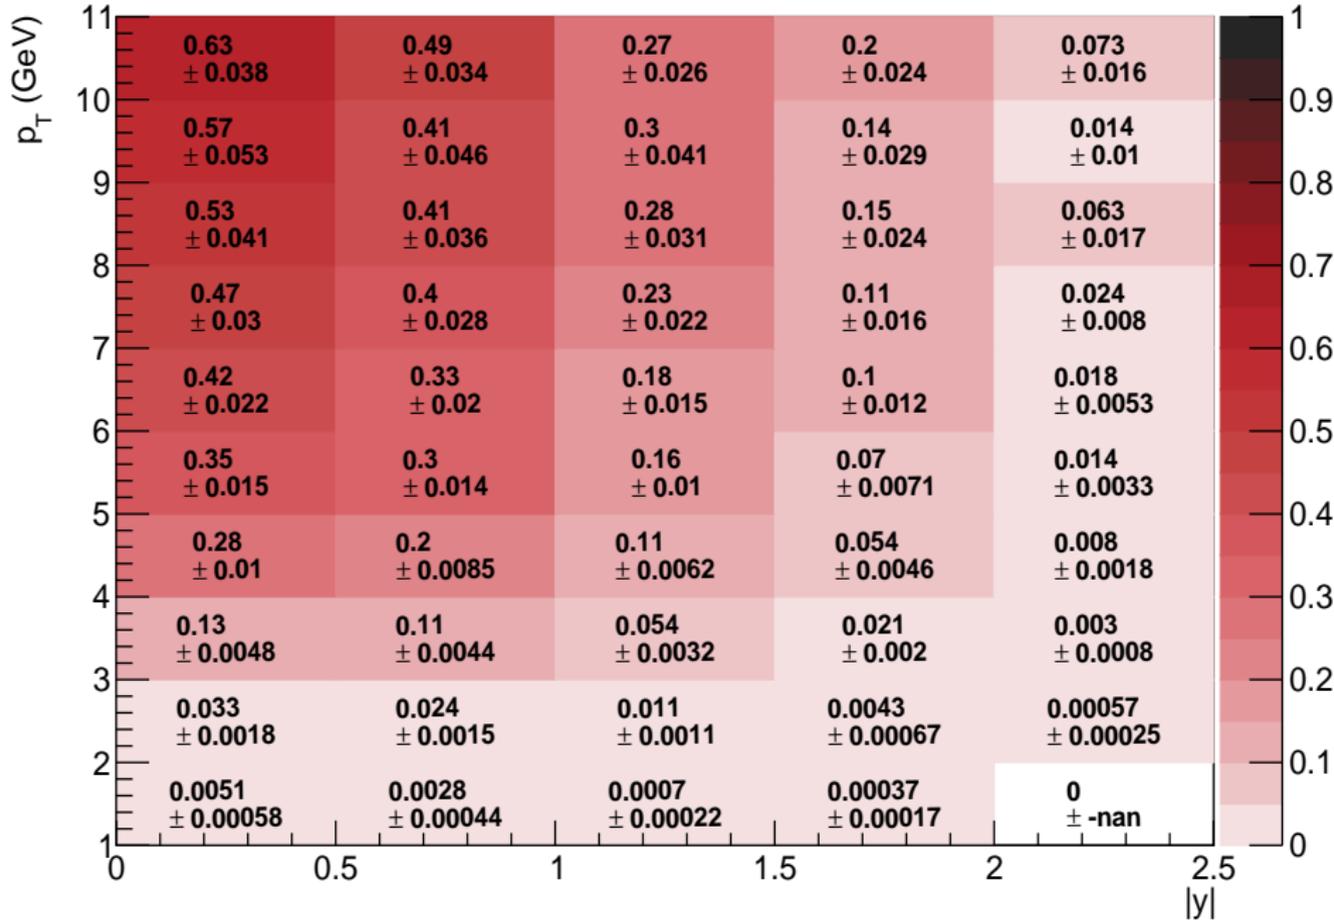

$$A \cdot (\Delta m - m_{\pi^+})^B \cdot \exp[C \cdot (\Delta m - m_{\pi^+}) + D \cdot (\Delta m - m_{\pi^+})^2]$$

Efficiency of D^*

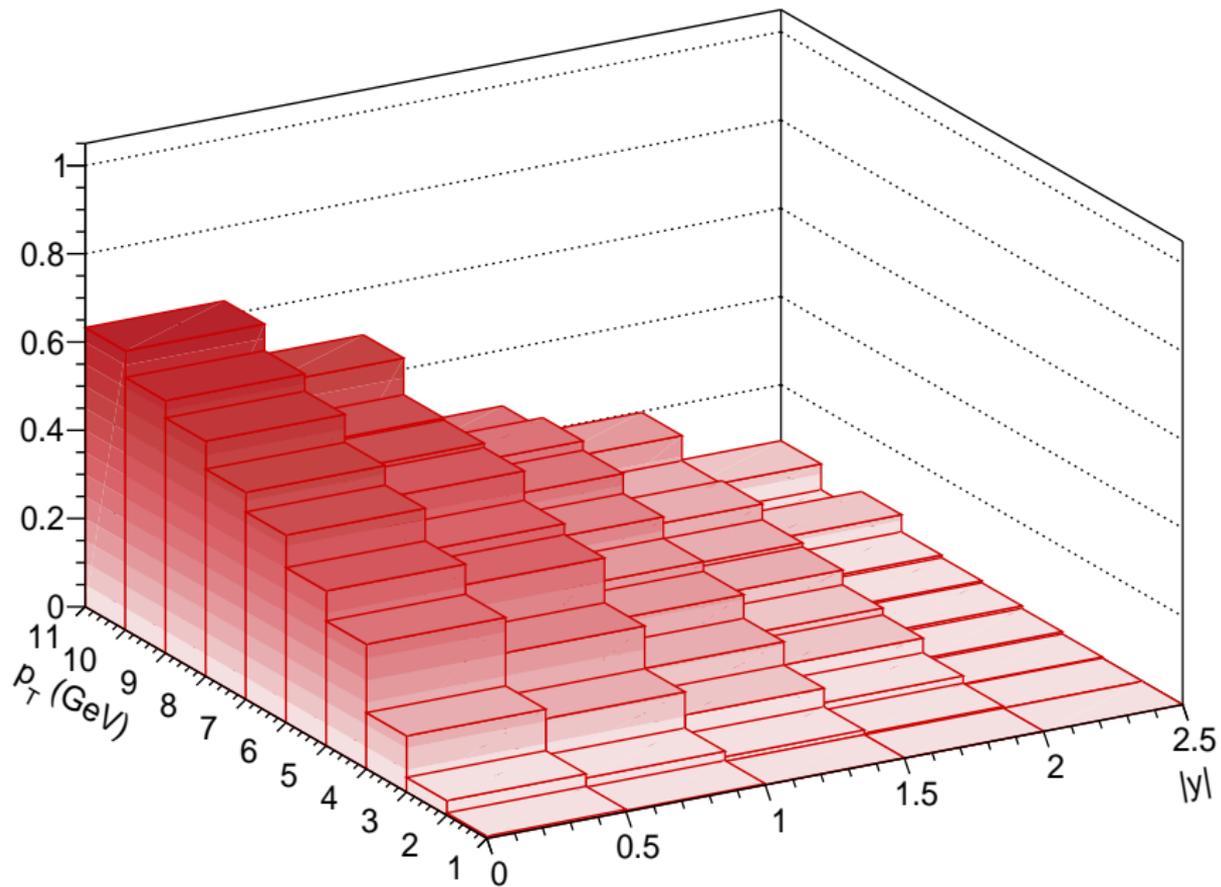

Information related to efficiency $D^* \rightarrow D^0 \pi$

- The requested MC datasets 7TeV are available at DESY site:
 - /MinBias_charmfilter_TuneZ2star_7TeV-pythia6-evtgen/LowPU2010DR42-NoPU2010_DR42_START42_V17B-v2/AODSIM $\sim 20M$
 - /MinBias_beautyfilter_TuneZ2star_7TeV-pythia6-evtgen/LowPU2010DR42-NoPU2010_DR42_START42_V17B-v2/AODSIM $\sim 2M$
 - /D0Kpi_pT0toInf_TuneZ2star_7TeV-pythia6-evtgen/LowPU2010DR42-NoPU2010_DR42_START42_V17B-v2/AODSIM $\sim 6M$
 - /DplusKpipi_pT0toInf_TuneZ2star_7TeV-pythia6-evtgen/LowPU2010DR42-NoPU2010_DR42_START42_V17B-v2/AODSIM $\sim 5M$
- Charm fragmentation fraction:
 - $f(c \rightarrow D^*) = 0.23$
 - $f(c \rightarrow D^0) = 0.61$
- Branching ratio (BR):
 - $D^* \rightarrow D^0 \pi = 0.68$
 - $D^0 \rightarrow K \pi = 0.039$
- For MC charm filter:
 - $\frac{N_{reco\&true}}{N_{true}} / (0.039 * 0.68)$ (For D^*)
 - $\frac{N_{reco\&true}}{N_{true}} / (0.039/2)$ (For D^0)

eff_{D*⁻→Kππ} in MC charm

eff_{D*⁻→Kππ} in MC charm

Luminosity

Luminosity

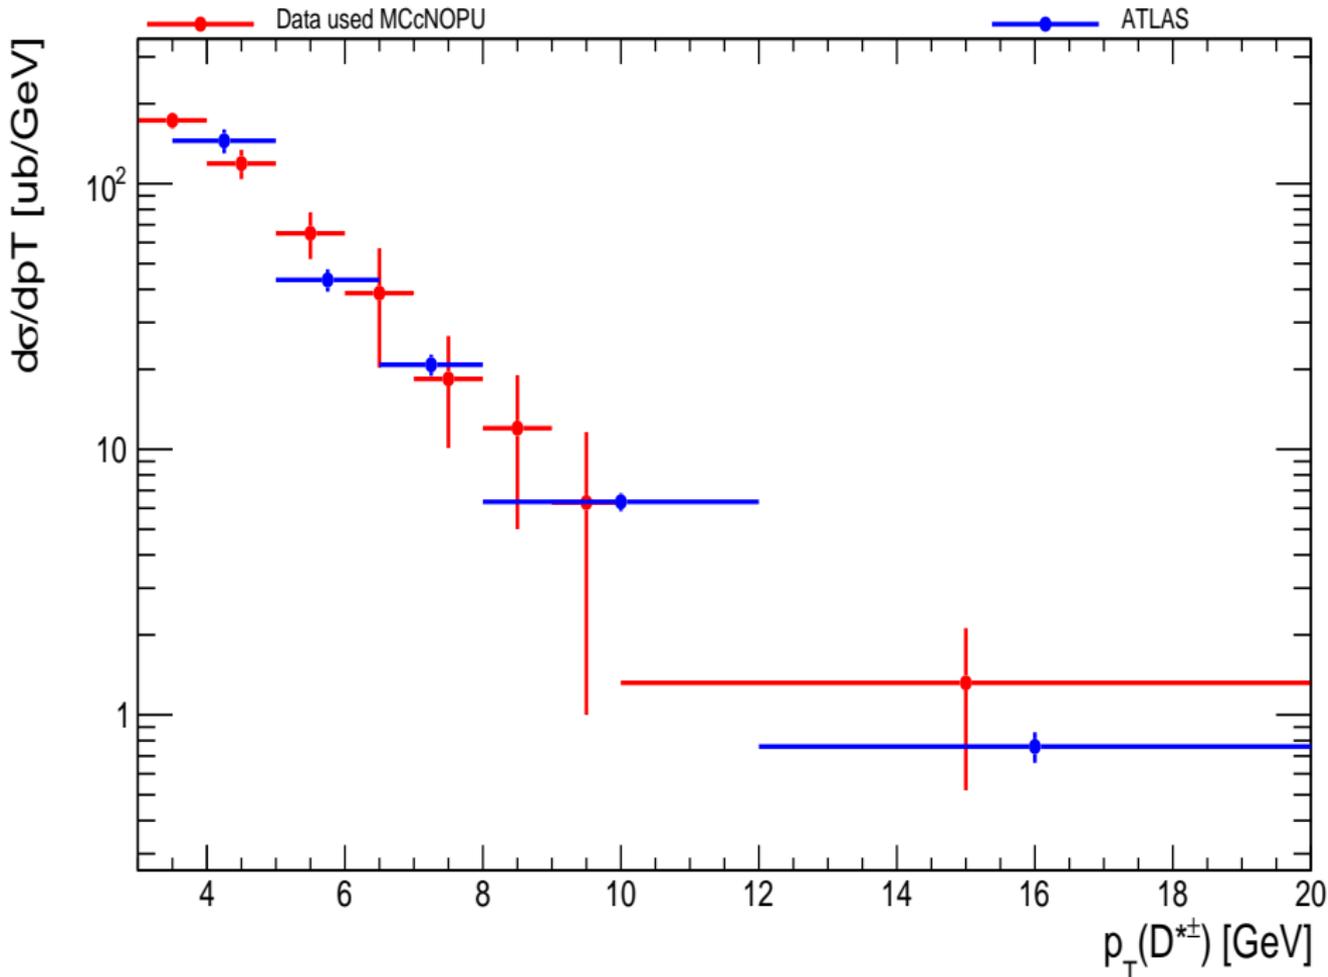

- The calculation of luminosity using brilcalc was conducted
- Command that I used as recommended in Lumi twiki in [here](#):
 - `brilcalc lumi -type hfoc -i
Cert_136033-149442_7TeV_Apr21ReReco_Collisions10_JSON_v2.txt -hltpath
HLT_ZeroBias`
- However, the information is not quite right
- Investigation and some discussion with other people is ongoing
- Therefore, estimate luminosity was used to calculate this cross section

```

#Summary:
+-----+-----+-----+-----+-----+-----+
| hltpath      | nfill | nrun | ncms | totdelivered(/ub) | totrecorded(/ub) |
+-----+-----+-----+-----+-----+-----+
| HLT_ZeroBias | 76    | 272  | 71876 | 283101.916047805  | 277327.126526316 |
+-----+-----+-----+-----+-----+-----+
#Sum delivered : 283101.916047805
#Sum recorded  : 277327.126526316

```

Cross section of D^*

Conclusion

- N_{signal} was determined using background subtraction method
- Fitting will be used for systematic later on
- The efficiency in MC charm looks reasonable
- At this moment, luminosity is the estimate luminosity. Need to investigate more on this
- First look at the cross section is successful
- The shape of the cross section looks correct
- For charm and beauty separation, see Josry's presentation

Any suggestions and questions are welcome!

Backup

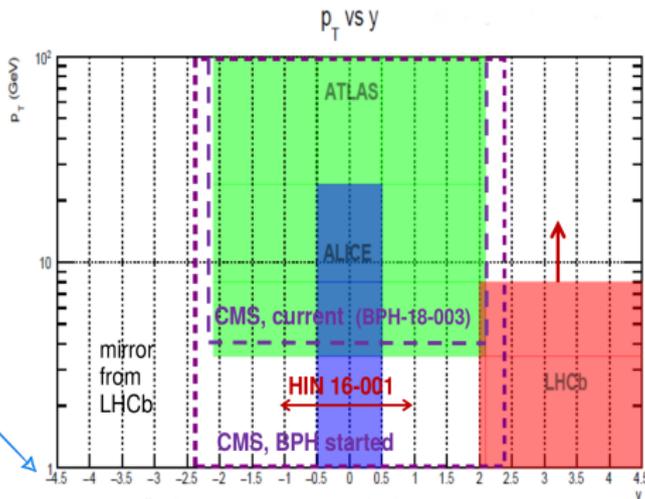

Introduction overview

- **Objective:** To measure the total cross section of inclusive charm at different pp center of mass energies (0.9, 2.7, 5, 7, 8, 13 (from PU in BParking) TeV)
- **Why?** Test NNLO QCD, constraints on PDFs, measurement of charm quark mass
- So far, only parts of phase space are measured at LHC
- **CMS + LHCb** together can **cover** essentially **full phase space** of $\sigma_{c\bar{c}}^{tot}$
- **Challenge:** Acceptance of D mesons at low p_T

$\sigma_{c\bar{c}}^{tot}$ expected to be ~ 10 mb!

CMS (5 & 13 TeV)
arXiv:1708.04962
BPH-18-003

Goal:
Measure D mesons
down to p_T 1 GeV

ATLAS (7 TeV)
arXiv:1512.02913v2

LHCb (5, 7 & 13 TeV)
arXiv:1610.02230v2
arXiv:1302.2864v1
arXiv:1510.01707v6

ALICE (2.76, 5 & 7 TeV)
arXiv:1205.4007v3
arXiv:1901.07979
arXiv:1111.1553v3

Analysis strategy in general

Rho Z

CMS Experiment at LHC, CERN
Data recorded: Tue Aug 2 09:15:27 2016 CEST
Run/Event: 278018 / 1233678348
Lumi section: 679

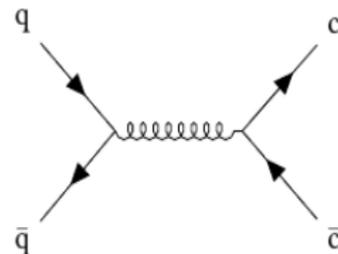

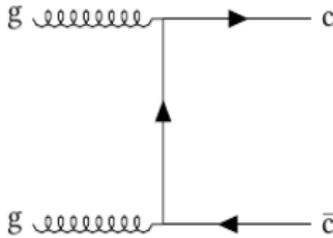

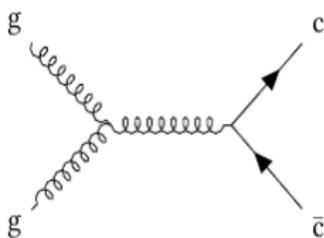

Data Zero Bias 13 TeV event display

It shows several primary vertices in an event

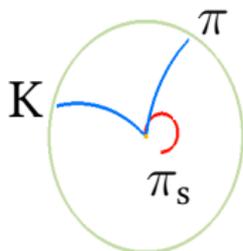

1 out of 10 vertices is expected to be charm vertex

We use all primary vertices for our analysis!

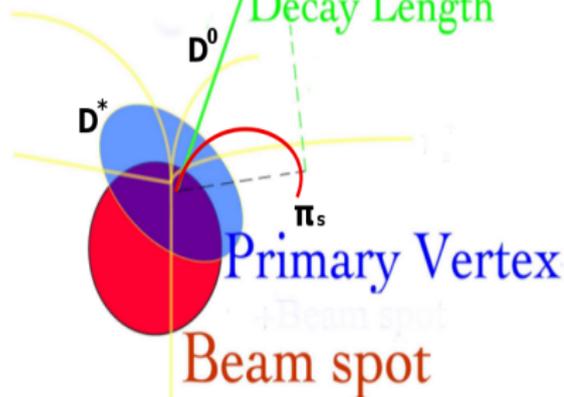

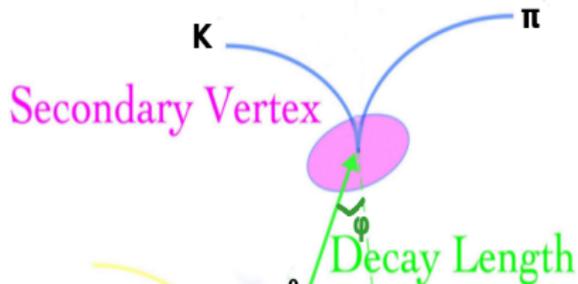

D meson reconstruction

CMS Experiment at LHC, CERN
 Data recorded: Sun Oct 17 06:06:53 2010 CEST
 Run/Event: 148031 / 442976968
 Lumi section: 554

MB 2010 Data

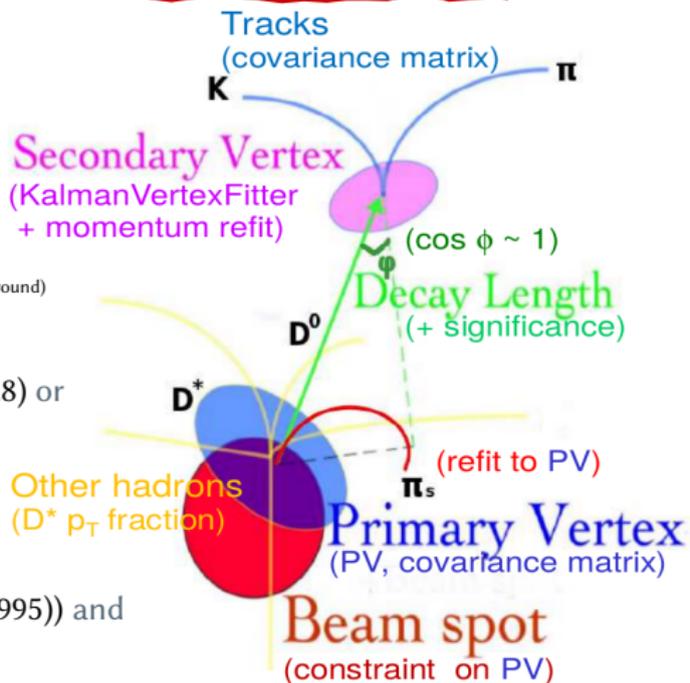

D*[±] → D⁰π[±] → K[∓]π[±]π[±] selection

optimized for
low p_T charm

$$p_{Tfrac} = \frac{p_T \text{ of D meson}}{\sum p_T \text{ of all tracks at respective PV}}$$

$$dl_{Sig}^{D^0} = \frac{dl^{D^0}}{dl_{err}^{D^0}}$$

- Track p_T cut
 - p_T^{K,π} > 0.5 GeV, none for π_s
- D⁰ mass cut
- Possible combination:
 - Right charge: K[∓]π[±]π_s[±]
 - Wrong charge: K[∓]π[∓]π_s[±] (combinatorial background)
- For higher p_T (p_T^{D*} > 3.5 GeV):
 - (dl_{Sig}^{D⁰} > 0 & p_{Tfrac}^{D*} > 0.15 and cosϕ > 0.8) or dl_{Sig}^{D⁰} > 2
- For lower p_T (p_T^{D*} < 3.5 GeV):
 - ((dl_{Sig}^{D⁰} > 1.5 & p_{Tfrac}^{D*} > 0.15) or dl_{Sig}^{D⁰} > 3 or (dl_{Sig}^{D⁰} > 2 and cosϕ^{D⁰} > 0.995)) and p_{Tfrac}^{D⁰} > 0.1 and cosϕ > 0.8

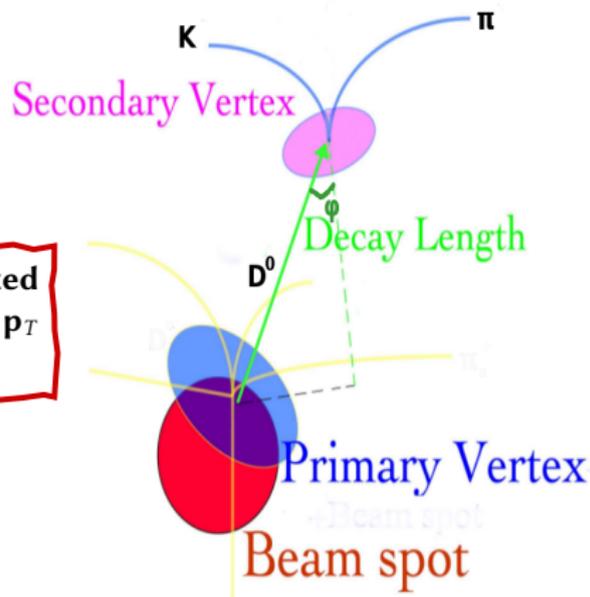

D⁰ / $\bar{D}^0 \rightarrow K^\mp \pi^\pm$ selection

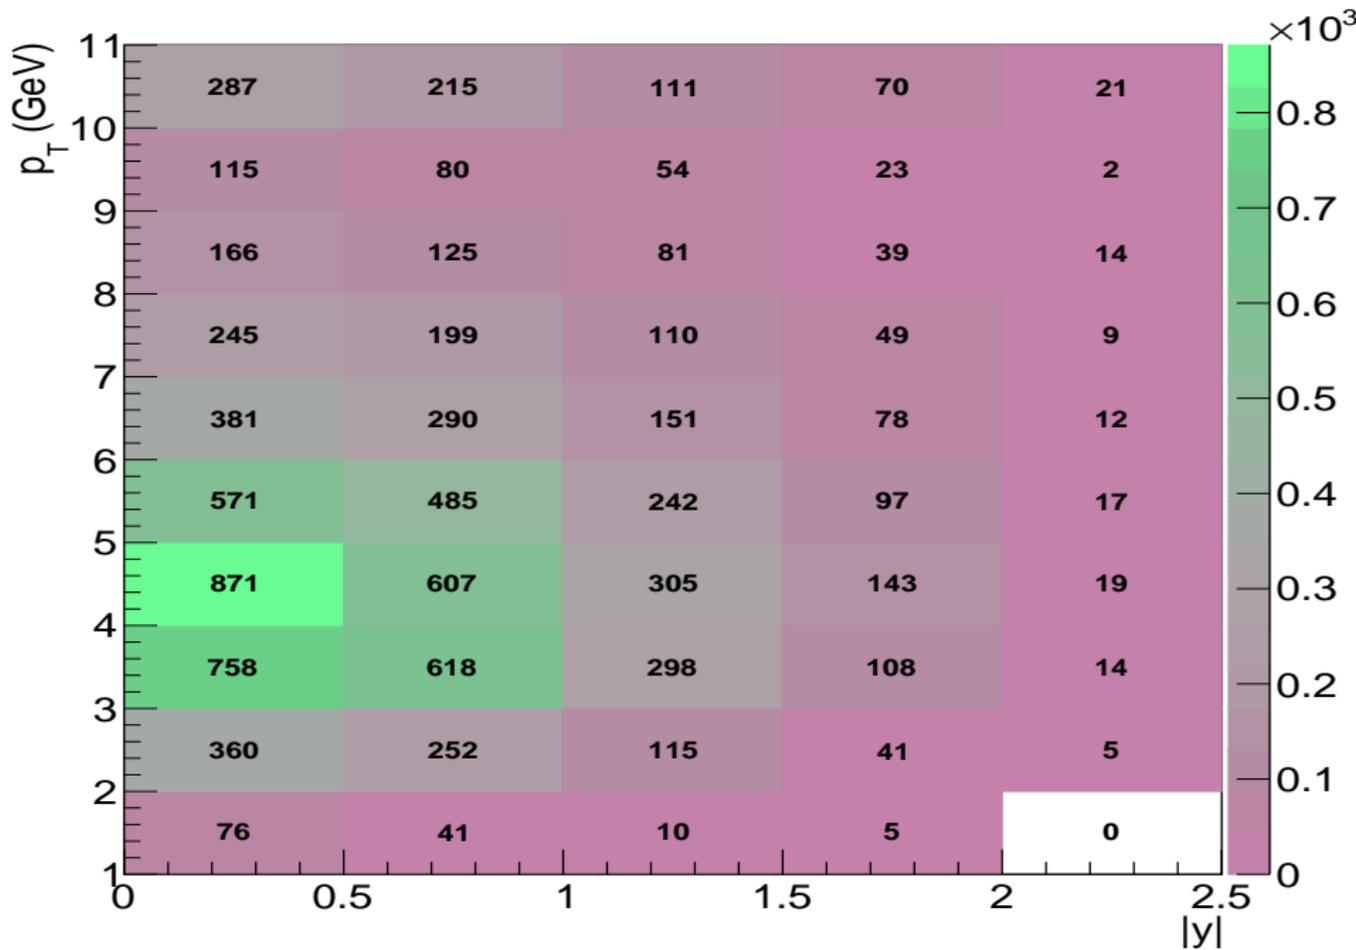

- $p_T^K > 0.5 \text{ GeV}$, $p_T^\pi > 0.5 \text{ GeV}$
- $1.68 < m_{D^0} < 2.05 \text{ GeV}$
- For higher p_T ($p_T^{D^0} > 3.5 \text{ GeV}$):
 - $dl_{Sig}^{D^0} > 4$
 - $\cos\phi^{D^0} > 0.99$
- For lower p_T ($p_T^{D^0} < 3.5 \text{ GeV}$):
 - $dl_{Sig}^{D^0} > 3.5$
 - $\cos\phi^{D^0} > 0.99$

optimized
for low p_T
charm

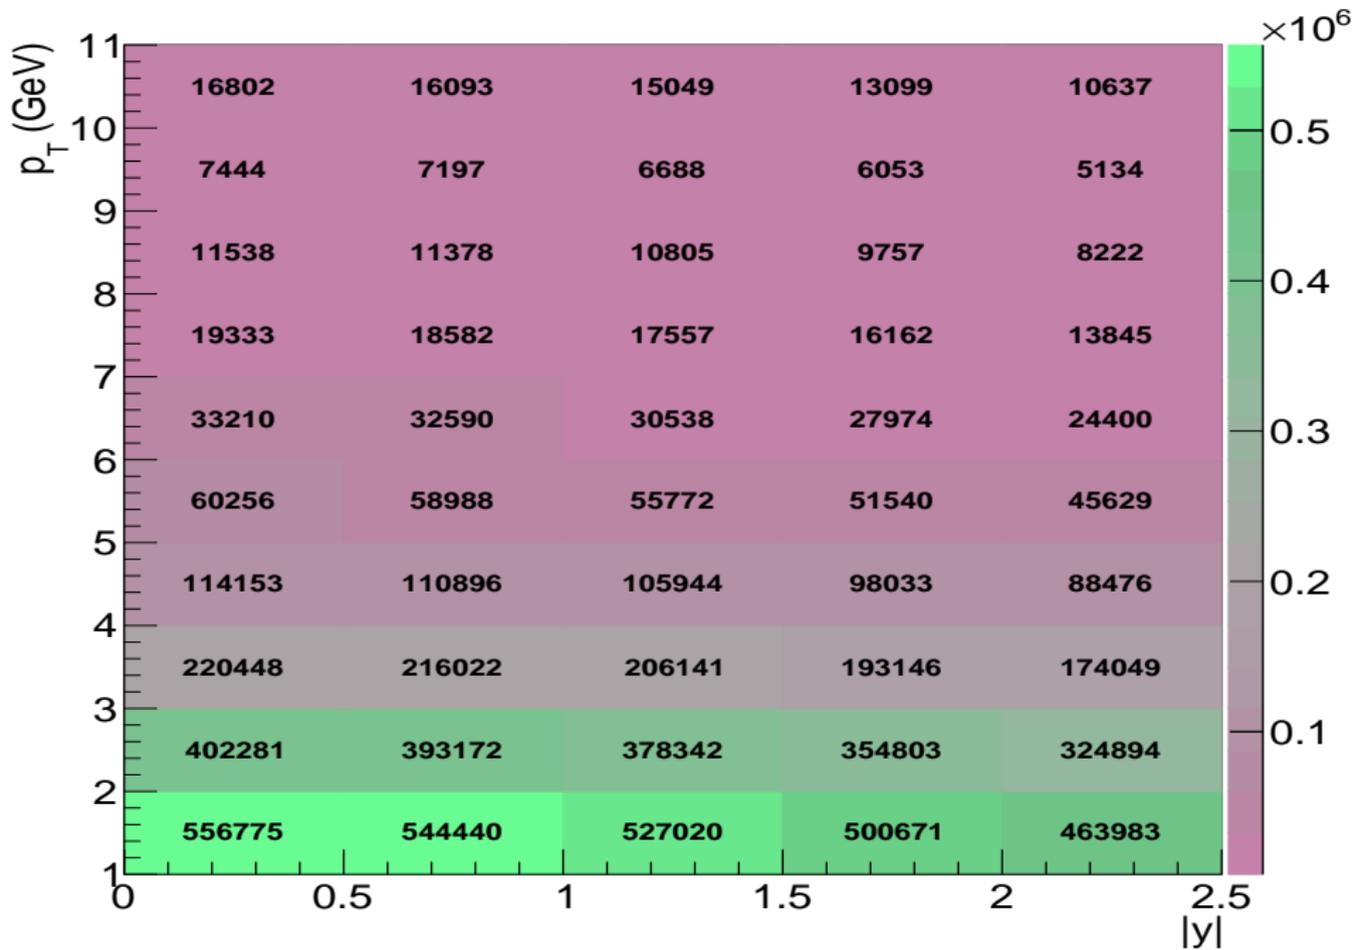

$$dl_{Sig}^{D^0} = \frac{dl^{D^0}}{dl_{err}^{D^0}}$$

ATLAS: Calculated cross section of D^* with kinematic phase space, $|\eta| < 2.1$ and $3.5 < p_T < 100$ GeV

Experiment	Trigger	Integrated lumi	Nsignal	Cross section
$3.5 < p_T < 20$ GeV (low p_T)	- Triggers: first level trigger MB & second level trigger random triggers (these triggers are unbiased for the evt of interest)	- take into account prescale, so integrated lumi = 1.04 nb ⁻¹	- Nsig of $D^{*\pm} = 2140 \pm 120$ (stat)	- cross section of $D^{*\pm} = 331 \pm 18$ (stat)
$20 < p_T < 100$ GeV	- Triggers: first level trigger jet trigger with threshold 5, 10, 15 GeV for $20 < p_T < 30$, $30 < p_T < 40$ and $40 < p_T < 100$ GeV respectively.	- take into account prescale for 5 & 10 GeV, so integrated lumi = 28 and 90 nb ⁻¹ respectively. For 15 GeV, no prescale, so lumi = 280 nb ⁻¹	- Nsig of $D^{*\pm} = 732 \pm 34$	- cross section of $D^{*\pm} = 988 \pm 45$ (stat)

DIFFERENTIAL CROSS SECTIONS OF $D^{*\pm}$
