

Looking at vertices in phase-3 data

V. Babu, C. Niebuhr
Jan 20, 2019

- The objective of the study was to use converted photon vertices to look at deviations of the PXD geometry from its design geometry.
- In particular, we wanted to look at:
 - Longitudinal deformations of the PXD ladders
 - Displacements from ideal positions in the x-y plane, and
 - Whether the carbon fiber cooling tubes were bending and touching any of the modules.

Kfit

Treefit

RAVE

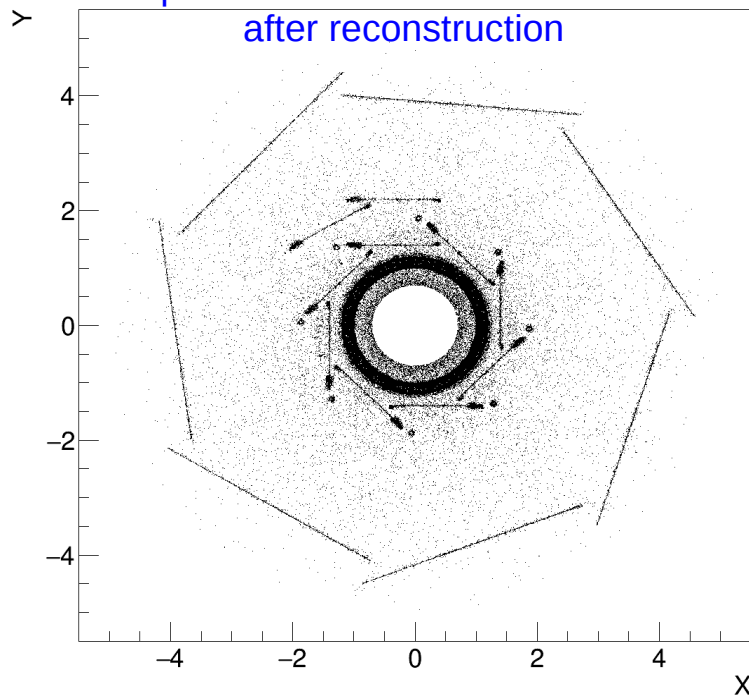

- RAVE seems to perform better than Kfit and Treefit for converted photons.
- Objects away from PXD sensitive region seem to be poorly resolved. In particular, the beam-pipe and carbon-fibre tubes are not visible.
- Overlapping sensor regions seem to have an artifact of what appears to be radially extended 'beams'.
- The real vertex density seems to be strongly related to the sensitive region of the PXD. Vertices are absent for dead module 1.3.2

3-Track vertices
(From secondary hadronic
interaction vertices)

Y:X {(Rho < 5 && Z > -3 && Z < 6)&&(vtx_chiProb > 0.01)}

Displaced 3-track vertices for MC at
after reconstruction

- Taking a cue from other experiments, we try secondary hadronic interaction vertices.
- They have better resolving power due to larger opening angles compared to photon conversion vertices
- We look for displaced 3-track vertices having a pion mass hypothesis for all tracks
- Indeed detector components look much better resolved. Beam-pipe, cooling pipes and lateral end-of-stave of PXD modules are clearly visible

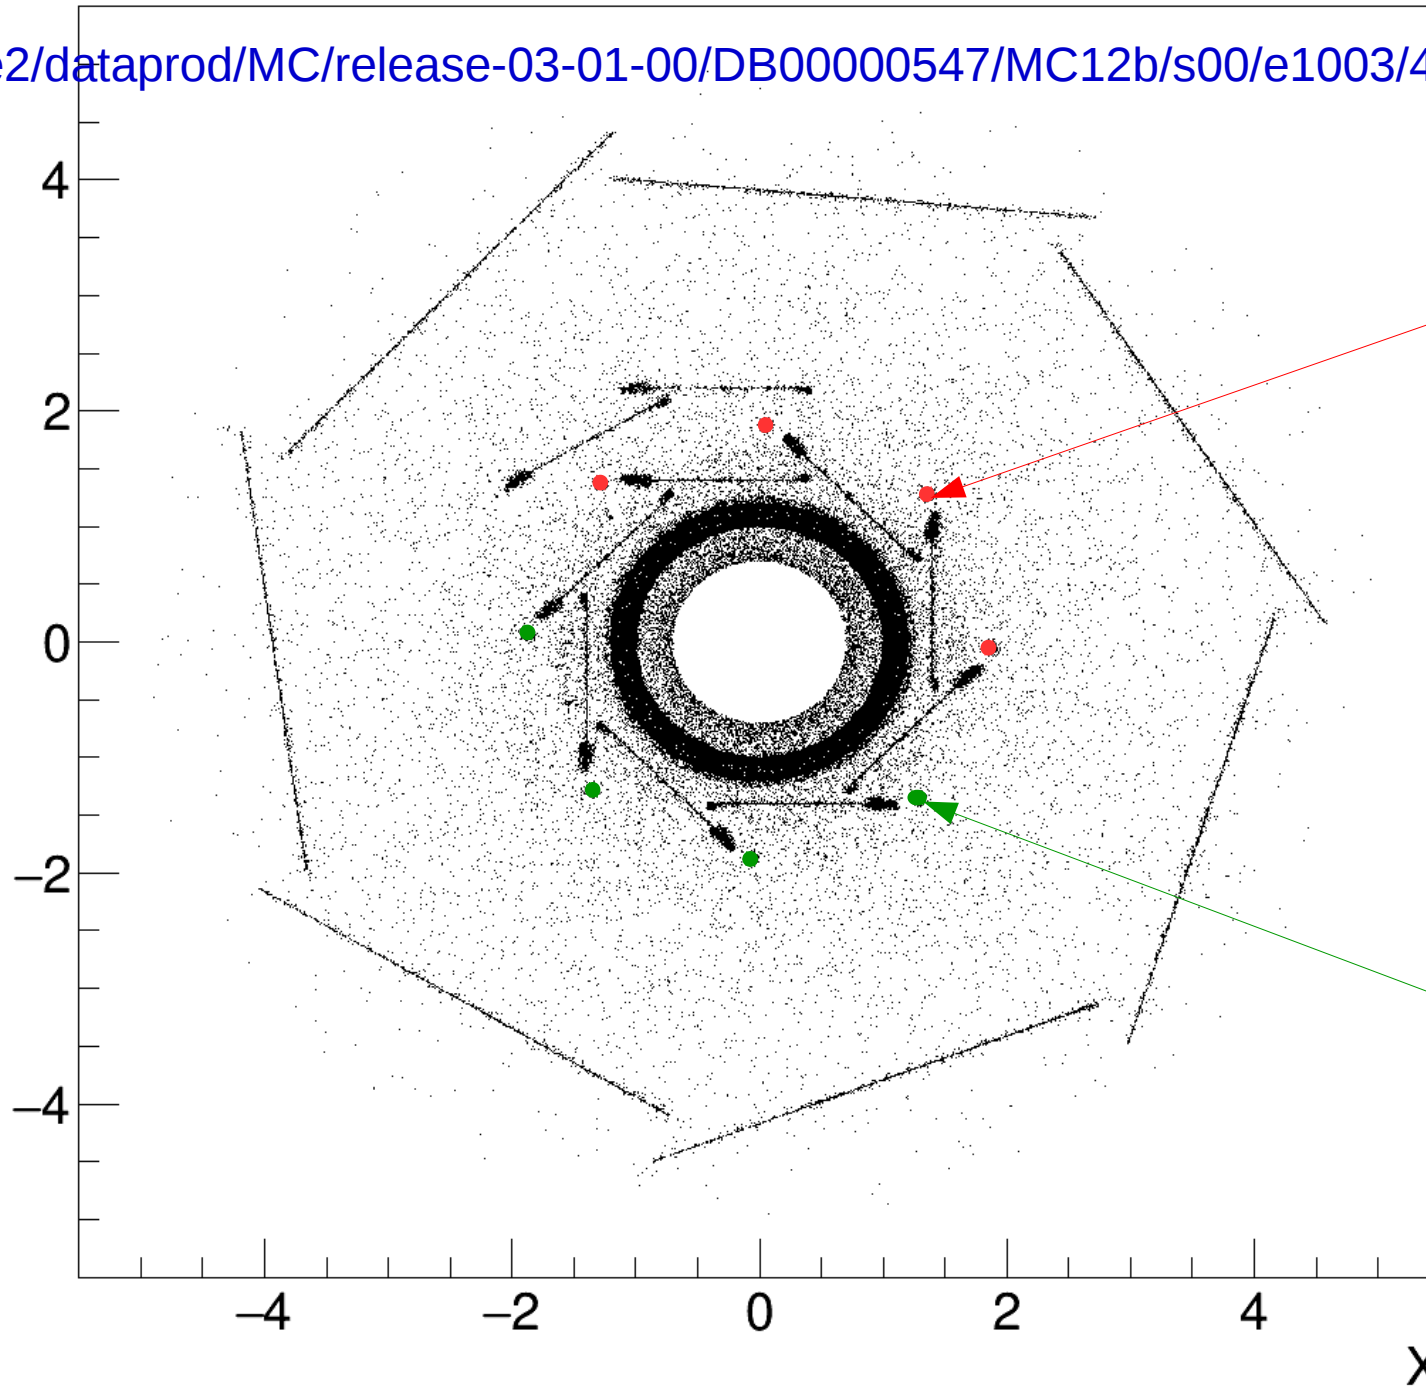

In MC, resolution in all three directions seem to be ~ 100 – 120 μm
Near the PXD-beam pipe region

Y:X {(Rho < 5 && Z > -3 && Z < 6)&&(vtx_chiProb > 0.01)}

Generic MC :

Global tag: data_reprocessing_proc9

Exp 7, Exp 8

"Good runs"

Y:Z {(vtx_chiProb > 0.1)&&(Rho < 3 && Z > -3 && Z < 6)}

X:Z {(vtx_chiProb > 0.1)&&(Rho < 3 && Z > -3 && Z < 6)}

Hot regions (!?)
Some form of
scattering off the
SCB faces?

X-Z and Y-Z projections of the PXD

2-Track vertices

Graph

MC

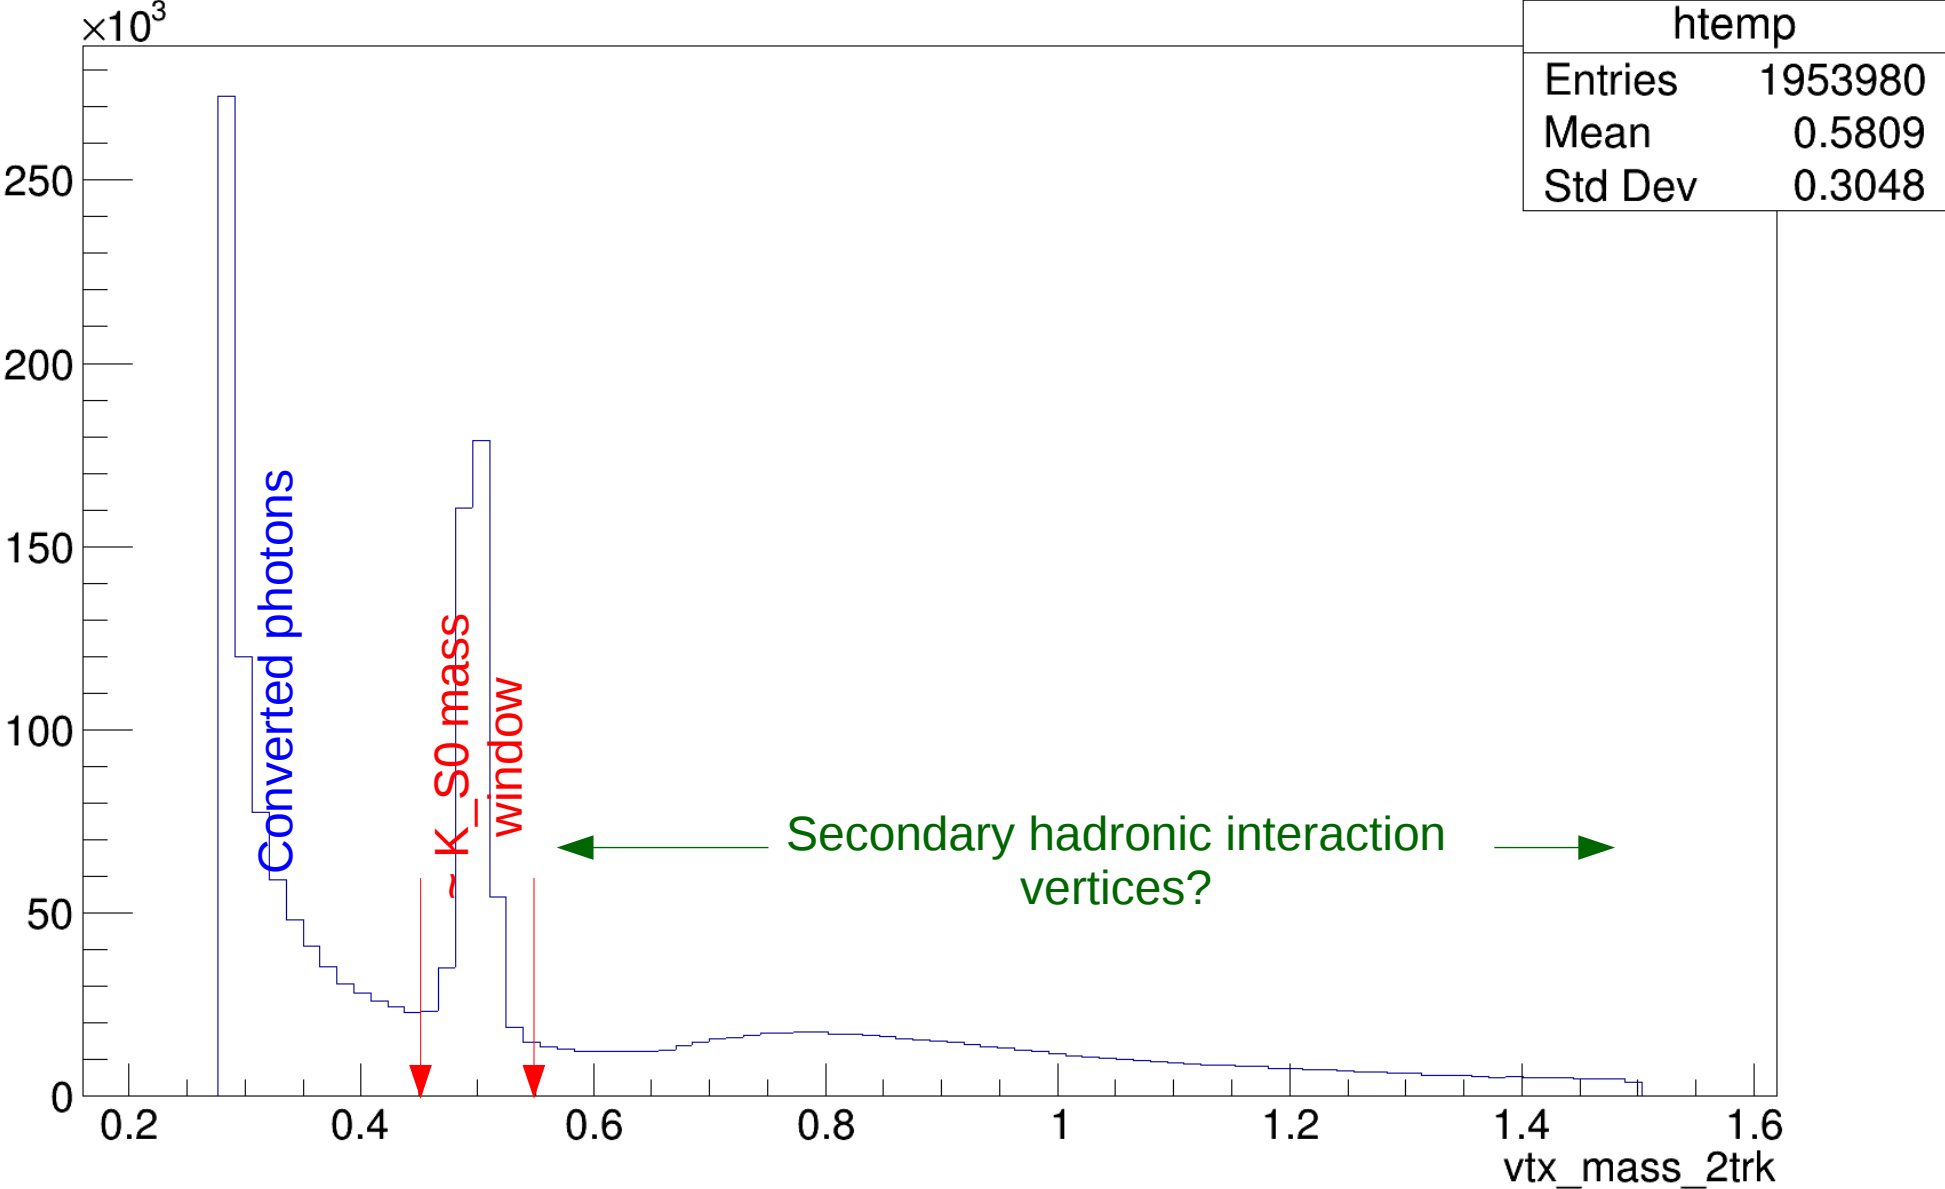

Red – Atleast one daughter belonging to Kshort

Green – Atleast one daughter belonging to converted photon

Violet – Atleast one daughter belonging to Lambda(bar)

Blue – Everything else

Graph

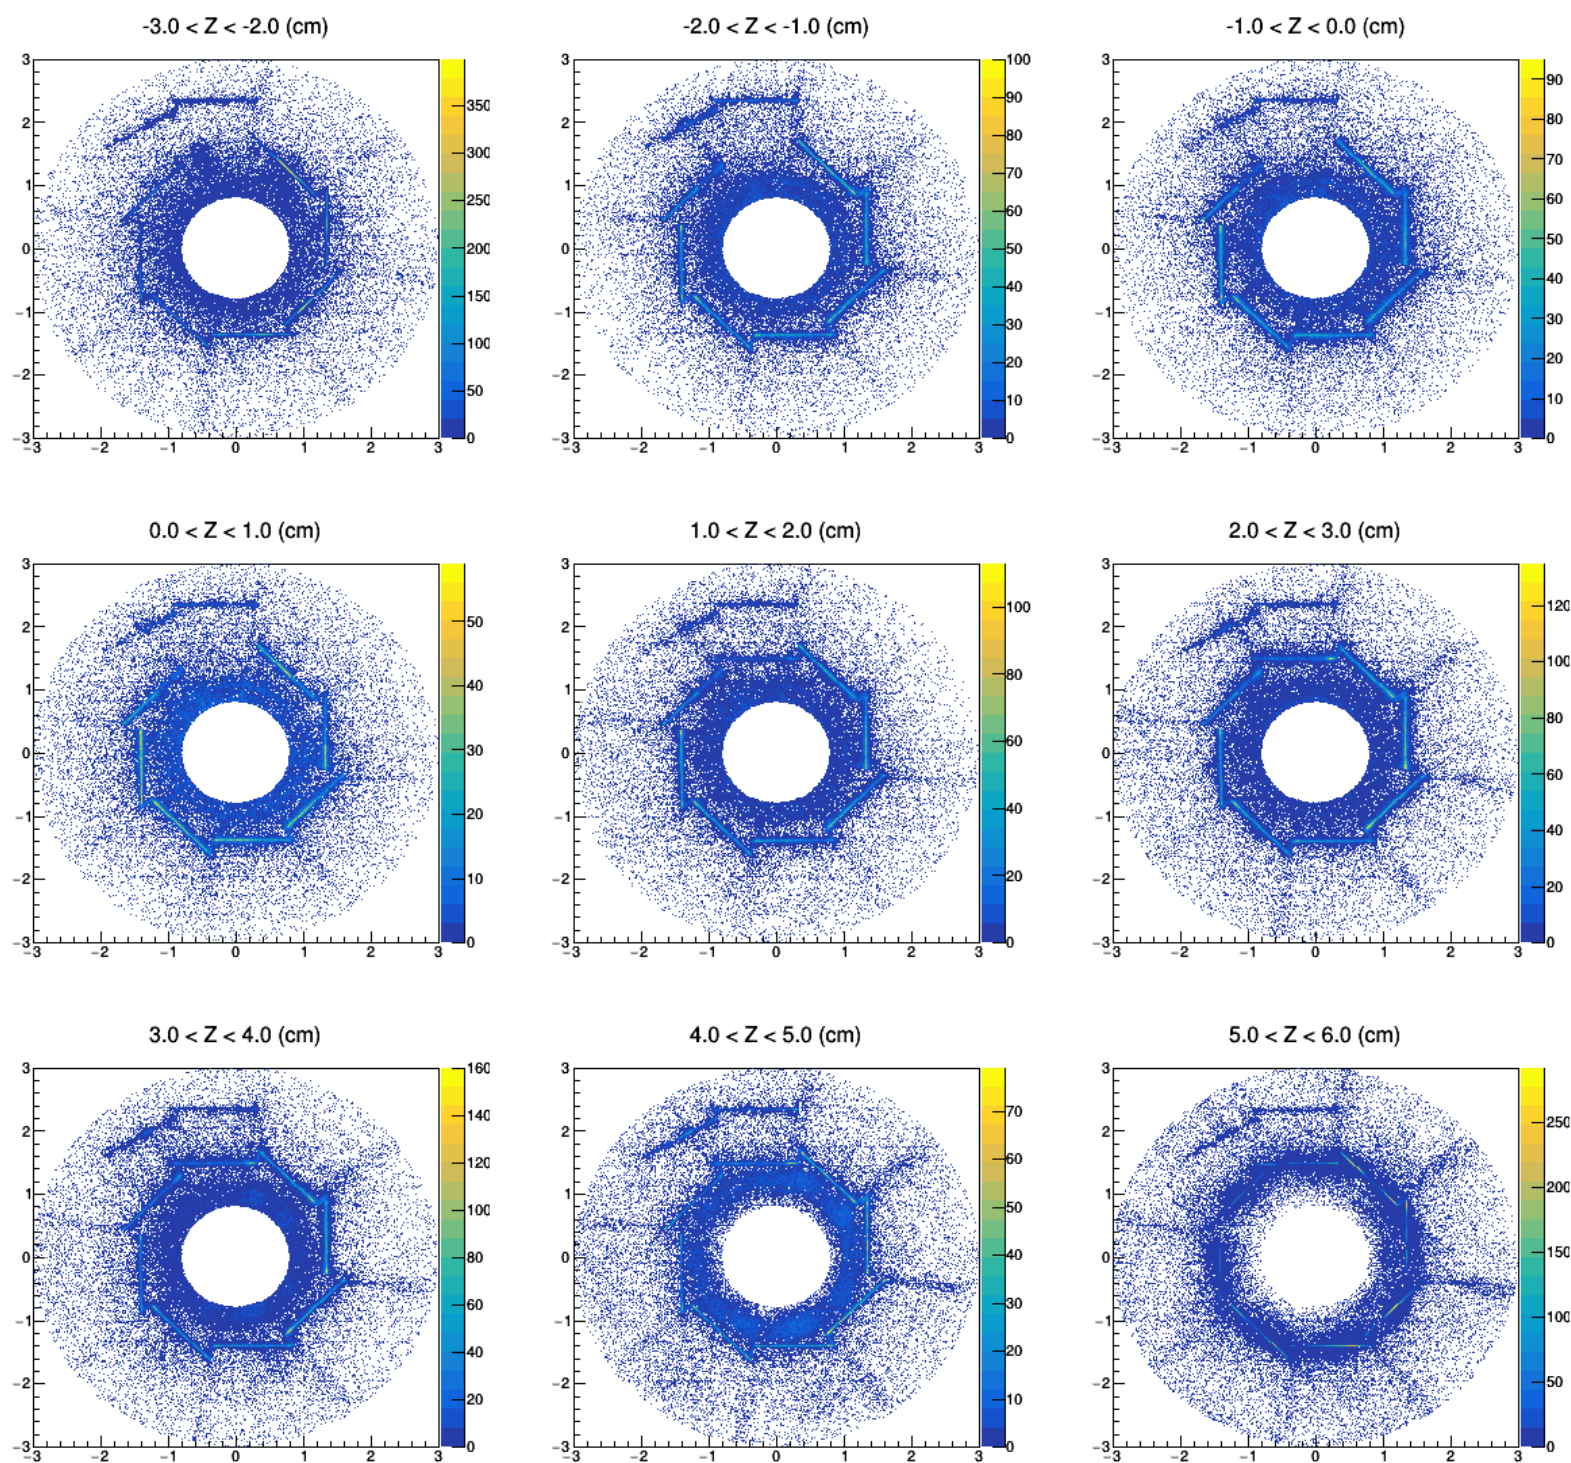

Data

$-3.0 < Z < 6.0$ (cm)

Invariant mass < 450 MeV : We recover the converted photon vertex density map

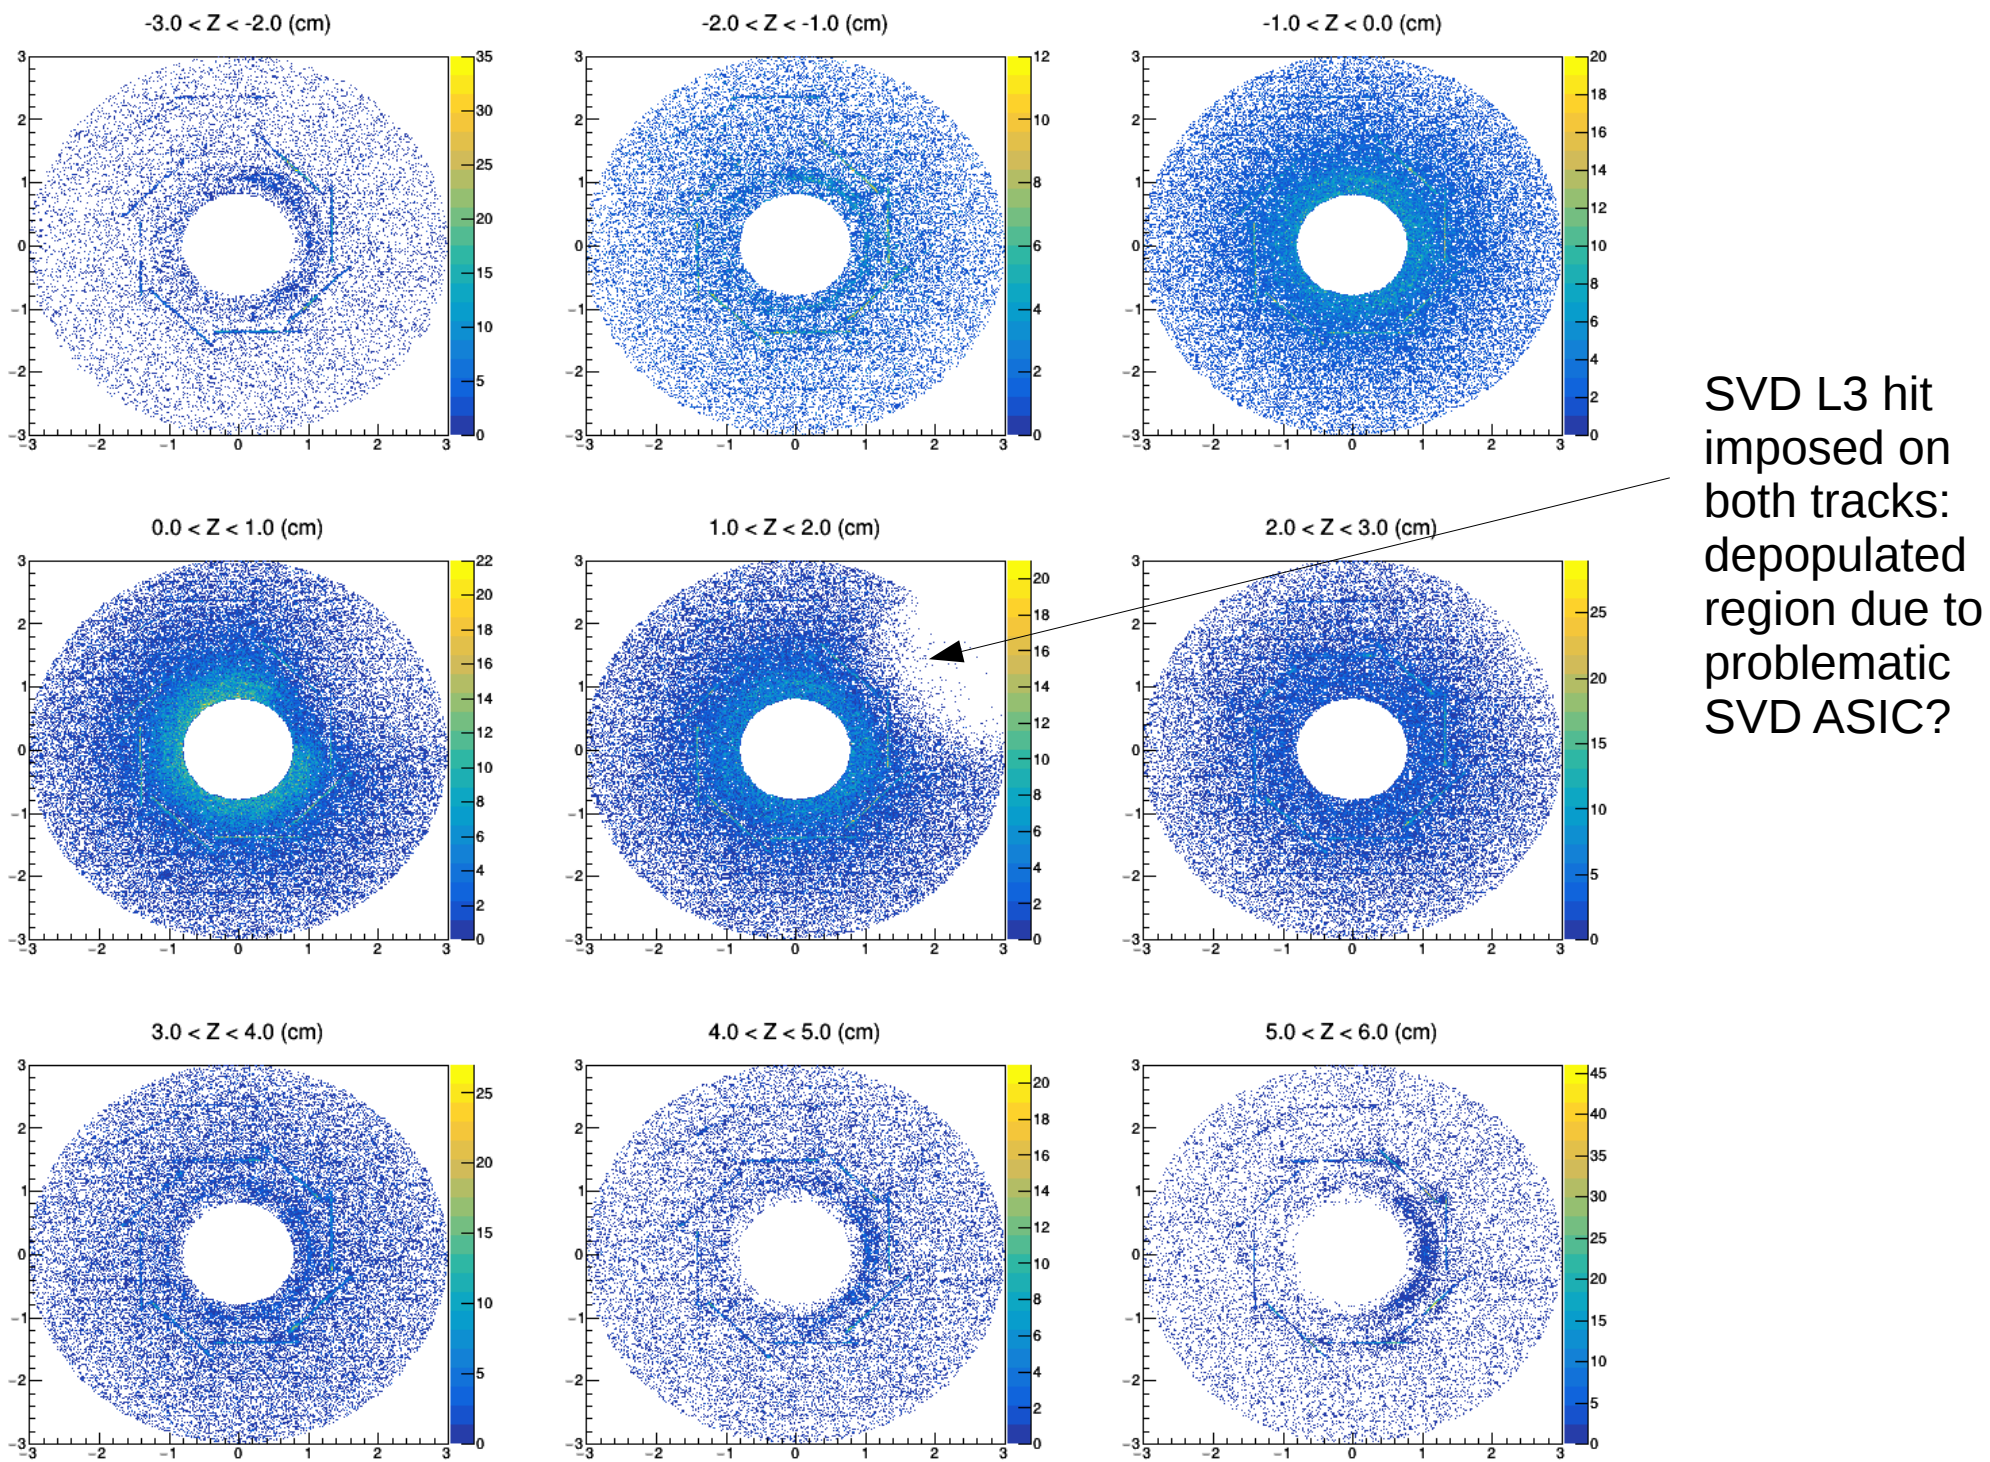

Invariant mass < 450 MeV : 1 cm z-slices

$-3.0 < Z < 6.0$ (cm)

$450 \text{ MeV} < \text{Invariant mass} < 550 \text{ MeV}$: Kshort mass window

450 MeV < Invariant mass < 550 MeV : 1 cm z-slices

h1

Invariant mass > 550 MeV : Some of it must be secondary hadronic interaction vertices

- Beam pipe more well resolved compared to converted photons

We see regions of more illumination go from right to left as we go along z.

Same as the effect due to scattering off SCB face shown before?

Invariant mass > 550 MeV : 1 cm z-slices

Longitudinal projections of PXD ladders

L2-Top sensor

Layer-2 Ladders

- Almost all hits near PXD sensitive region contain PXD hits and are therefore directly biased by PXD alignment. Therefore the plots are essentially a reflection of PXD alignment
- Alignment parameters for PXD modules in the same ladder were estimated independent of each other. The deformations in w-direction agree very well between the two modules at the center of the ladder => Indicates that alignment procedure works very well!

upstream?

Inv-mass > 550 MeV

Side-View

- We are at the moment trying an alternate method to improve the converted photon vertex, trying to remove the bias in the vertex position.

Thank you!
