

# Flavour physics.

Terascale Summer School 2020

Sam Cunliffe  
11.08.2020

# Goals for this lecture

- 0) What is flavour and “flavour physics”.
- 1) Understand the basics and motivations of flavour physics
  - Enough to talk to us even if you don’t end up working in our field.
  - Know the names and rough idea behind four of the important b-physics experiments.
  - Know enough to “get the gist” of a flavour physics paper.
- 2) Know a bit about “recent anomalies” and their implications
  - Real cutting-edge physics results.

# What is the Standard Model?

Precision of statement

An effective relativistic quantum field theory gauge invariant under  $SU(3) \cdot SU(2) \cdot U(1)$ .

A Lagrangian density which is the closest we've come to finding the Lagrangian density of nature.

A collection of quantum fields and their couplings.

A collection of quantum fields and their interactions.

A collection of different types of squiggly lines and rules to draw them.

A framework for theorists to calculate predictions of measurable quantities

A table of particles on wikipedia.

A set of rules for really small and really fast things.

Amount of QFT lectures necessary

# What is the Standard Model?

	I	II	III

# Flavour-changing neutral currents

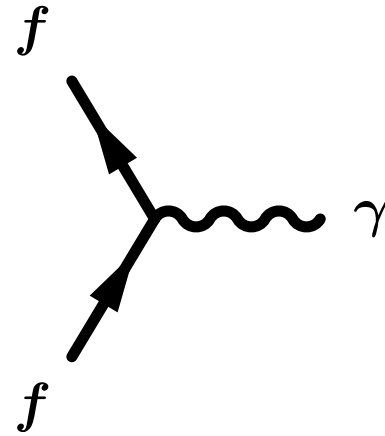

- I told you flavour physics people love jargon.
- Here is an important one.
- Flavour-changing neutral current (**FCNC**)
- They are famously **forbidden at tree level in the Standard Model**.
- Hopefully that's now clear what it means.

# Summary and caveats

- The Standard Model is a set of rules.
- It's a little ad-hoc. But it's the most precise theory we have at the moment.
- All of what I've been saying is true “within the Standard Model”.
  - If you're playing according to the SM's rules.
- We think/hope/expect it's **not** really how nature is.
- It's just our best guess at the moment.

# You should know: there are problems with the Standard Model

$$\begin{bmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{bmatrix} = \begin{pmatrix} \text{large} & \text{small} & \text{very small} \\ \text{small} & \text{large} & \text{small} \\ \text{very small} & \text{small} & \text{large} \end{pmatrix}$$

Photo: NASA/Chandra X-ray Observatory / Wikimedia Commons

# You should know: there are problems with the Standard Model

Matter-antimatter asymmetry (in nature)

Mass values (in particular: neutrino masses)

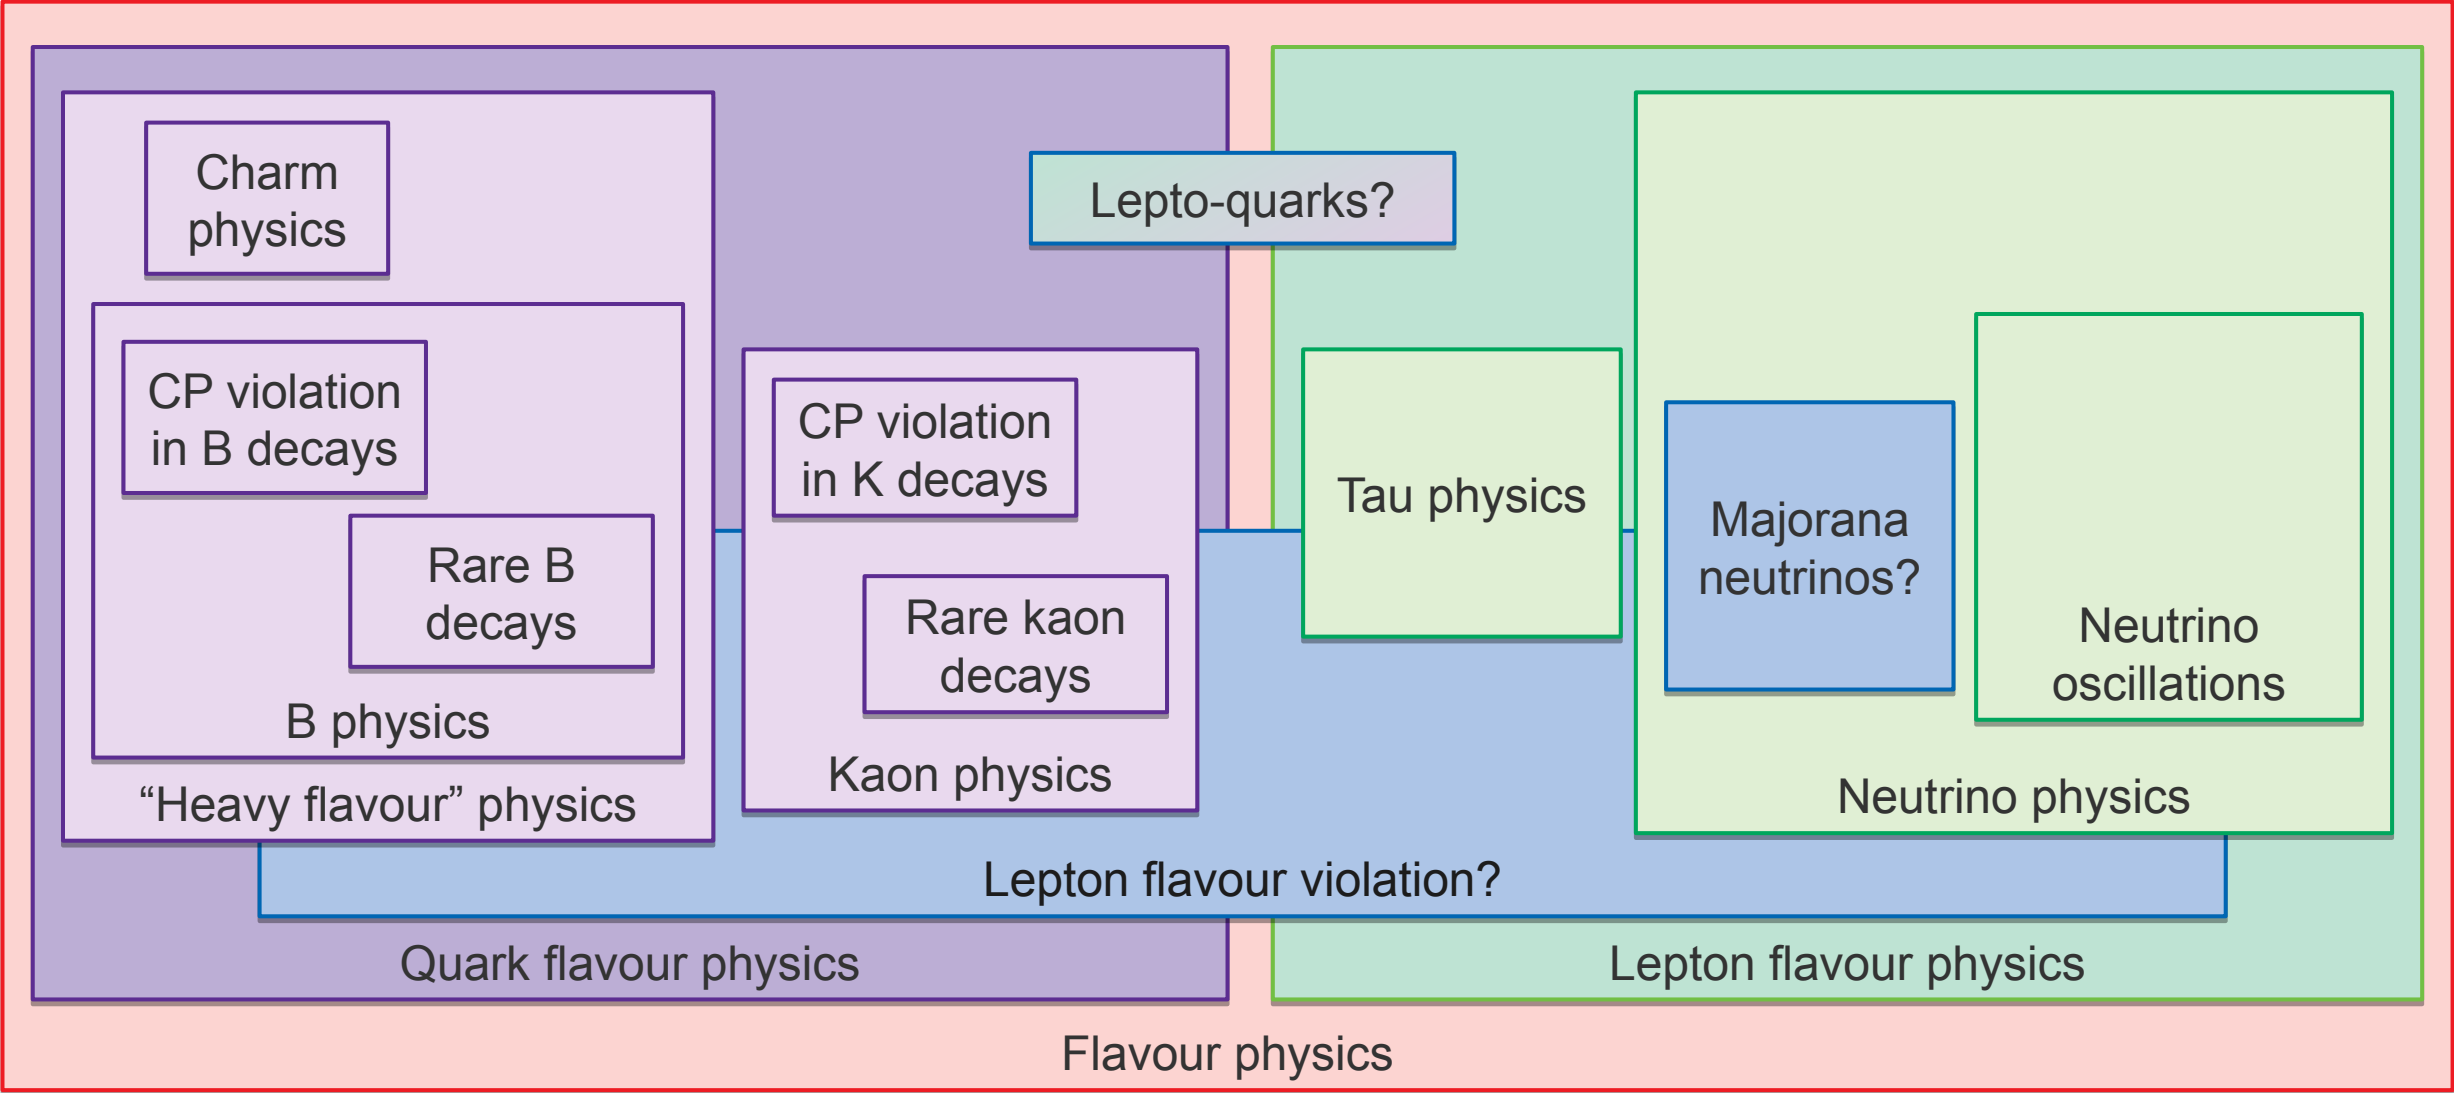

Dark matter

$$\begin{bmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{bmatrix} = \left( \begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array} \right) \text{CKM Structure}$$

The diagram shows the CKM matrix structure with red circles of varying sizes representing the magnitudes of the elements. The largest circles are in the diagonal elements  $V_{ud}$ ,  $V_{cs}$ , and  $V_{tb}$ .

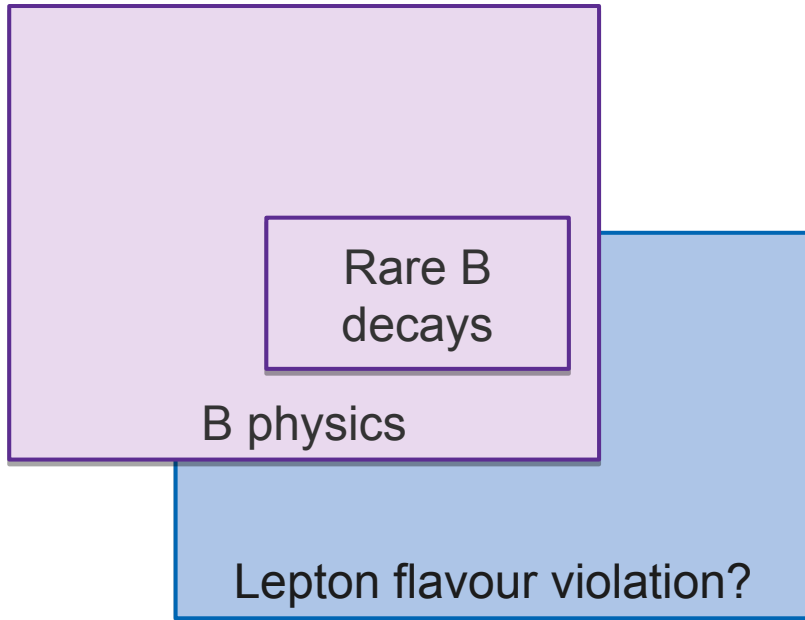

Photo: NASA/Chandra X-ray Observatory / Wikimedia Commons

# I hope this diagram is helpful

# Now we specialise

- I want to focus on active research in flavour physics.
- The main sub-field is basically B physics.
  - ▶ It's what most people think of a flavour physics.
  - ▶ It's also what you probably would do a master/PhD in.
  - ▶ It's what I can talk about.

**0. What?**

**1. Experiments**

**1. Observables**

**2. Rare decays and anomalies**

**2. The field in 202X**

# Experiments

## Dramatis personae

- B factory
  - ▶ Collides  $e^+e^-$  at precisely the energy to create an  $\Upsilon(4S)$ .
  - ▶ An  $\Upsilon(4S)$  is a meson made of a  $b\bar{b}$  pair. It decays almost 100% to  $B\bar{B}$ .
  - ▶ ... Hence “factory”.
- What other designs are there?
  - ▶ Fixed target (HERA B)
  - ▶ “Pseudo” fixed target (LHCb)
  - ▶ General purpose detectors (CDF, D0, CMS, ATLAS)

$$\Upsilon(b\bar{b})$$

$$B^+(\bar{b}u)$$

$$B^-(b\bar{u})$$

$$B^0(\bar{b}d)$$

$$\bar{B}^0(b\bar{d})$$

$$B_s^0(\bar{b}s)$$

$$\bar{B}_s^0(b\bar{s})$$

# Experiments

## The B factories

$$e^+e^- \rightarrow Y(4S) \rightarrow BB$$

$$\sqrt{s} = 10.58 \text{ GeV (asymmetric beams)}$$

BB system is clean and well constrained

### Belle

1999–2010, Japan  
(French for 'beauty')

### BaBar

1999–2008, USA  
(The king of the elephants,  
name sounds like BB)

## LHC

$$pp \rightarrow bb + ?$$

$$\sqrt{s}_{2016} = 6.5+6.5 \text{ TeV}$$

BB system is not  
well constrained

### LHCb

2010–Present, CERN, France  
(Rubbish name, dubious logo)

# LHCb

A little bit more detail

# LHCb

A little bit more detail

# Belle II

# Belle II

**new**  
Two layers of  
DEPFET high  
granularity pixel  
detector

Silicon vertex  
detector

Drift chamber  
for tracking  
wires in gas

# Belle II

## The B factories

BB system is clean and well constrained

- Collision energy is well known
- Good at neutral particles / missing energy / neutrino final states / taus

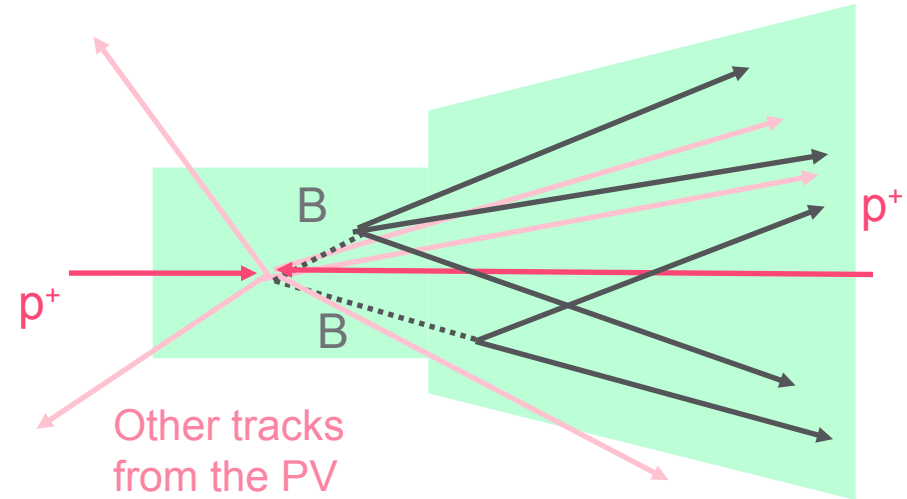

- Single particle tracking
- Good at vertexing B decays
- Good at hadron identification

## LHC

$pp \rightarrow bb + ?$

$\sqrt{s}_{2016} = 6.5+6.5 \text{ TeV}$

BB system is not well constrained

- Collision energy not well known
- High energy, running longer @ high production
- Very good at muons

**0. What?**

**1. Experiments**

**1. Observables**

**2. Rare decays and anomalies**

**2. The field in 202X**

# Observables

## Ratio, difference, asymmetry

- Almost all flavour physics papers are measuring some kind of **constructed observable**.
- The branching ratio / fraction is the ratio of the rate decay for  $B \rightarrow f$  to all decays of the B.

$$\begin{aligned}\mathcal{B}(B \rightarrow f) &\equiv \frac{\Gamma(B \rightarrow f)}{\Gamma_{\text{T}}} \\ &= \frac{N_{B \rightarrow f}}{\epsilon_{B \rightarrow f}} \frac{\epsilon_{\text{norm.}}}{N_{\text{norm.}}} \mathcal{B}(\text{norm.})\end{aligned}$$

- It's very common to make either: a **ratio**, a **difference**, or **asymmetry**, or some combination of the three.
- The first two are easy. Usually denoted “R” and  $\Delta$ .
- Examples:  $R_{D^*}$ ,  $R_{K^*}$ , angular observables.

# Observables

## Ratio, difference, asymmetry

- Often we form asymmetries
  - “CP asymmetries”
  - or “isospin asymmetries”
  - or “time-dependent-CP-asymmetries”.
- These are all the same basic quantity **formed between rates of different decay modes.**
- That quantity is the difference over the sum.

$$\frac{x - y}{(x + y)}$$

# How to do a b-physics measurement

## A template

- 1 Figure out a smart observable to measure.  
Smart means:
  - Minimises experimental uncertainties.
  - Is sensitive to some kind of extension to the SM –or– noone else ever did it before.
- 2 Look for candidate B meson decays for whatever final state you care about.
- 3 Make some event selection cuts to minimise the background.
- 4 Make a histogram of something (probably something like the **invariant mass**).
- 5 Either count the candidates you have, or fit signal + background model → returns you a “yield”.
- 6 Relate the yield or fit parameters to your observable.

$$m_{K\mu\mu} \equiv \sqrt{((p_K + p_\mu + p_\mu)^\alpha (p_K + p_\mu + p_\mu)_\alpha)}$$

**0. What?**

**1. Experiments**

**1. Observables**

**2. Rare decays and anomalies**

**2. The field in 202X**

# $b \rightarrow s \ell \ell$

$b \rightarrow s \ell \ell$

A hot topic

extended  
electroweak sector

$b \rightarrow s\ell\ell$

A hot topic

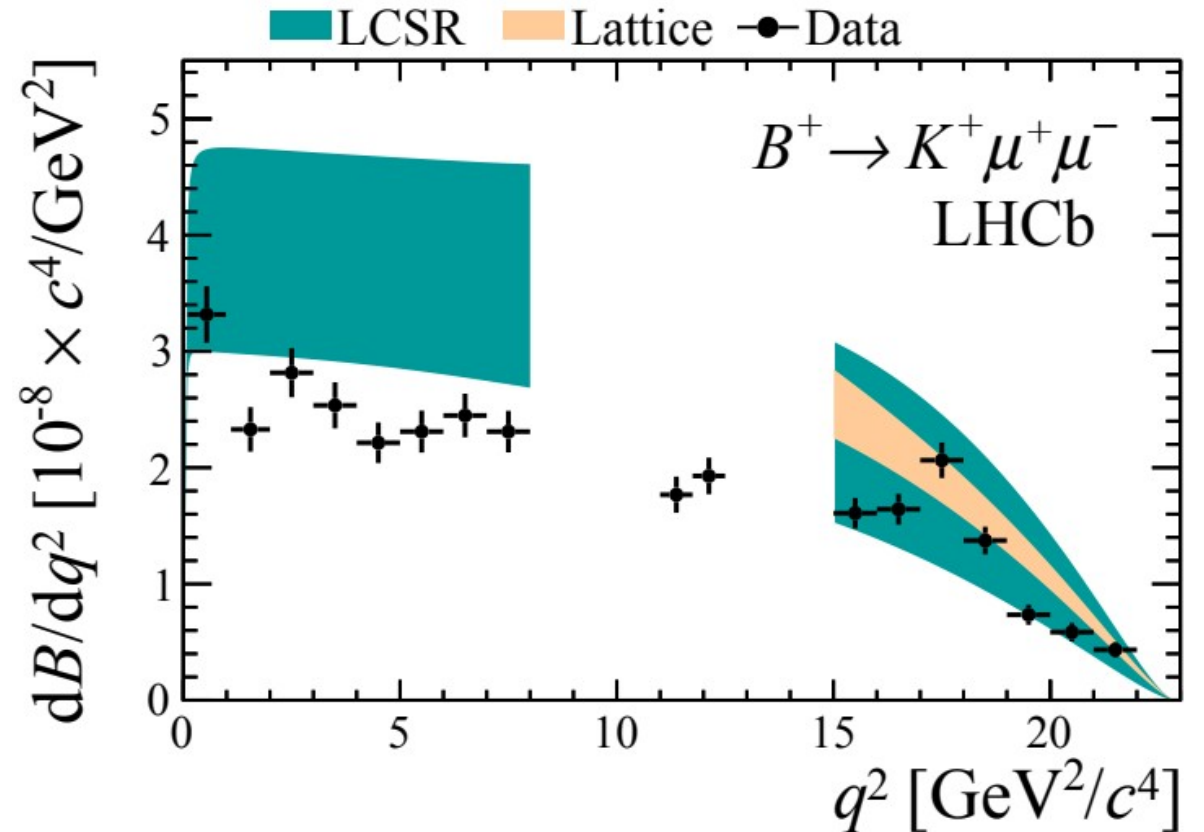

- Just before we get to the cool stuff, I need to introduce another piece of annoying jargon.
- It's kind of historical / stupid.
  - But everyone uses it.
  - And it's on a lot of axes for b-physics plots.
- The squared invariant mass of the pair of leptons.
$$q^2 = (p_{\mu^+} + p_{\mu^-})^\alpha (p_{\mu^+} + p_{\mu^-})_\alpha = m_{\mu\mu}^2$$
- You can think of it as like the internal energy share of the B decay products. Shared between the leptons and the quark bit.
- Why don't we ever say "q" on it's own? Why not  $m_{\mu\mu}^2$ ? .... I don't know.

# $B^+ \rightarrow K^+ \mu^+ \mu^-$

JHEP06(2014)133

- Take the  $b \rightarrow s \mu^+ \mu^-$  diagram
- ... add a spectator u...
- Make invariant mass ( $m_{K\mu\mu}$ ) plot,
- Fit to extract signal yield.
- Measurement is low wrt SM predictions at low  $q^2$ .

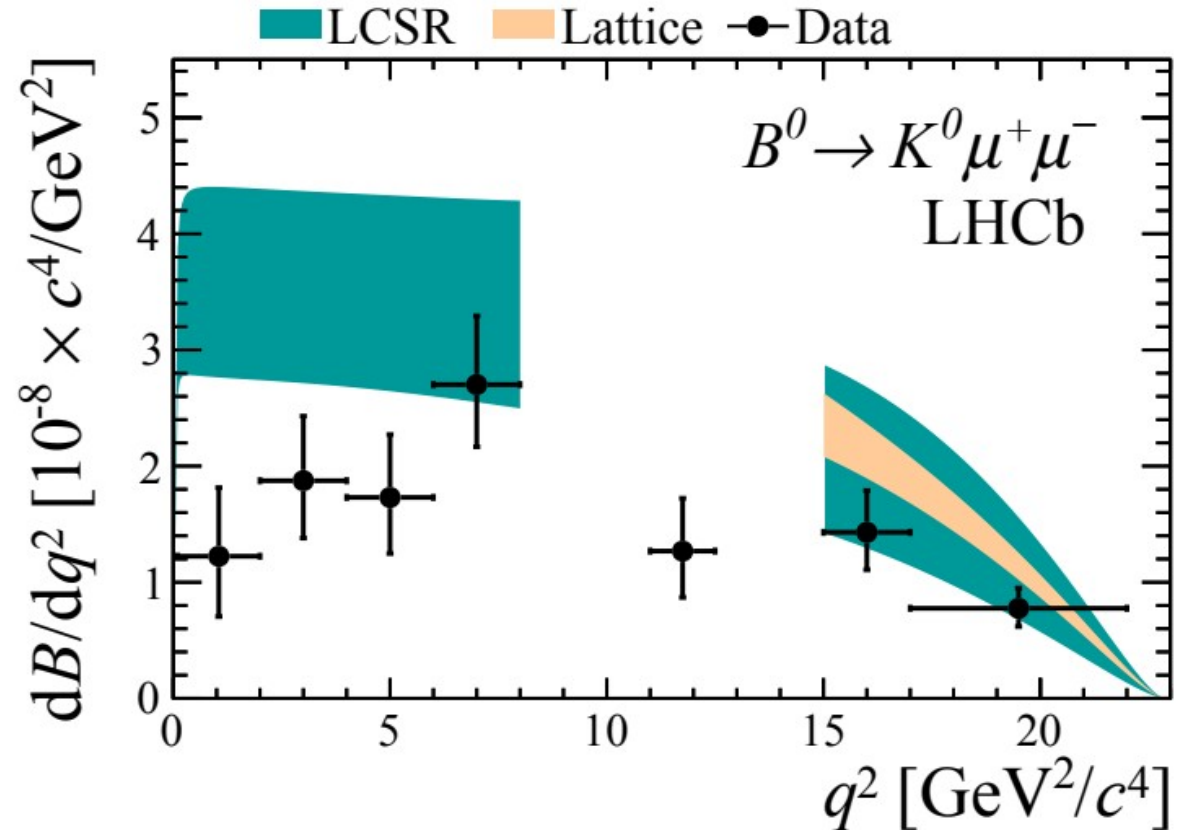

# $B^0 \rightarrow K_S^0 \mu^+ \mu^-$

JHEP06(2014)133

- Take the  $b \rightarrow s \mu^+ \mu^-$  diagram
- ... add a spectator d...
- Make invariant mass ( $m_{\mu\mu}$ ) plot,
- Fit to extract signal yield.
- Measurement is low wrt SM predictions at low  $q^2$ .

?  $\rightarrow$  ?  $\mu^+ \mu^-$

JHEP06(2015)115

- Take the  $b \rightarrow s \mu^+ \mu^-$  diagram
- ... add **two** spectators and flip the b quark direction ...
- Make invariant mass ( $m_{\rho\pi\mu\mu}$ ) plot,
- Fit to extract signal yield.
- Measurement is low wrt SM predictions at low  $q^2$ .

$\Lambda_b^0 \rightarrow \Lambda^0 \mu^+ \mu^-$   
 JHEP06(2015)115

- Take the  $b \rightarrow s \mu^+ \mu^-$  diagram
- ... add **two** spectators and flip the b quark direction ...
- Make invariant mass ( $m_{\rho\pi\mu\mu}$ ) plot,
- Fit to extract signal yield.
- Measurement is low wrt SM predictions at low  $q^2$ .

$B_s \rightarrow \phi^0 \mu^+ \mu^-$   
 JHEP09(2015)179

- Take the  $b \rightarrow s \mu^+ \mu^-$  diagram
- ... add a spectator s...
- Make invariant mass ( $m_{KK\mu\mu}$ ) plot,
- Fit to extract signal yield.
- Measurement is low wrt SM predictions at low  $q^2$ .

$$R_K = \mathcal{B}[B^+ \rightarrow K^+ \mu^+ \mu^-] / \mathcal{B}[B^+ \rightarrow K^+ e^+ e^-]$$

PhysRevLett.122.191801

- Remember why ratios are a good idea?
- Look at the x labels of the histograms, which is which mode?
- The SM predicts  $R_K = 1.000$ .
- LHCb observes  $0.846 \pm 0.07$ .

$$R_{K^*} = \mathcal{B}[B^0 \rightarrow K^{*0} \mu^+ \mu^-] / \mathcal{B}[B^0 \rightarrow K^{*0} e^+ e^-]$$

JHEP08(2017)055

- Same story.

# Is this the way the hints are pointing us?

**0. What?**

**1. Experiments**

**1. Observables**

**2. Rare decays and anomalies**

**2. The field in 202X**

## ... in summary

### Only *somewhat* impartial overview

- Flavour physics is interesting !  
Despite our problem with stupid nomenclature.
- We study the transitions between cells in “the table”.
- We divide, sum, take the difference, of observable quantities.  
... Like branching fractions.
- There are two main active b-physics experiments now:
  - ▶ Belle II is taking data (despite pandemics).
  - ▶ LHCb is upgrading the detector.
- I hope you consider a PhD in this (sub)field.
- If you don't, at least be friends with us! Now you know a bit of the lingo.

# How did I do?

- 0) What is flavour and “flavour physics”.
- 1) Understand the basics and motivations of flavour physics
  - Enough to talk to us even if you don’t end up working in our field.
  - Know the names and rough idea behind four of the important b-physics experiments.
  - Know enough to “get the gist” of a flavour physics paper.
- 2) Know a bit about “recent anomalies” and their implications
  - Real cutting-edge physics results.

# What next?

- This was quite a “full-on” lecture. Sorry about that.
- I will be online in the slack chat for the rest of the day. I made a **#flavour** channel.
- ...and you can email me! [sam.cunliffe@desy.de](mailto:sam.cunliffe@desy.de)
- There are some “fun” homework problems attached to the [agenda page](#) (maybe Olaf will collect all of the homework Q’s & A’s somewhere).
