

Discussion on alignment strategies for collisions

Introduction

With collisions coming up at the horizon, the questions about what alignment should provide start again. Some thoughts to this:

- ▶ “Hottest” topic in the alignment group are the large scale movements (e.g. PXB) on short timescales. Are these real? How do we investigate? Who can help?
- ▶ The alignment group asks for routine alignment with Millepede (e.g. nightly alignment run). What do we suggest to be aligned with data from one (1) day? Do we prefer other scenarios?
- ▶ How do we participate in routine alignment and how do we discuss arising problems?
