

Observation of $Z>2$ trapped nuclei by AMS on ISS

Friday 16 July 2021 19:18 (12 minutes)

The Alpha Magnetic Spectrometer collected over 150 billion cosmic rays events during the first 8.5 years of operation aboard the International Space Station. A component of $Z>2$ ions with rigidities below the rigidity cutoff and located in the South Atlantic Anomaly have been measured both in the down-going and up-going direction.
