# In memory of Steven Weinberg

VOLUME 19, NUMBER 21

PHYSICAL REVIEW LETTERS

20 NOVEMBER 1967

<sup>11</sup> In obtaining the expression (11) the mass difference between the charged and neutral has been ignored.

<sup>12</sup> M. Ademollo and R. Gatto, *Nuovo Cimento* 44A, 282 (1966); see also J. Pasupathy and R. E. Marshak, *Phys. Rev. Letters* 17, 888 (1966).

<sup>13</sup> The predicted ratio [eq. (12)] from the current alge-

bra is slightly larger than that (0.23%) obtained from the  $\rho$ -dominance model of Ref. 2. This seems to be true also in the other case of the ratio  $\Gamma(\eta \rightarrow \pi^+\pi^-\gamma)/\Gamma(\gamma\gamma)$  calculated in Refs. 12 and 14.

<sup>14</sup> L. M. Brown and P. Singer, *Phys. Rev. Letters* 8, 460 (1962).

## A MODEL OF LEPTONS\*

Steven Weinberg†

Laboratory for Nuclear Science and Physics Department,  
Massachusetts Institute of Technology, Cambridge, Massachusetts

(Received 17 October 1967)

Leptons interact only with photons, and with the intermediate bosons that presumably mediate weak interactions. What could be more natural than to unite<sup>1</sup> these spin-one bosons into a multiplet of gauge fields? Standing in the way of this synthesis are the obvious differences in the masses of the photon and intermediate meson, and in their couplings. We

and on a right-handed singlet

$$R \equiv [\tfrac{1}{2}(1-\gamma_5)]e. \quad (2)$$

The largest group that leaves invariant the kinematic terms  $-\bar{L}\gamma^\mu\partial_\mu L - \bar{R}\gamma^\mu\partial_\mu R$  of the Lagrangian consists of the electronic isospin  $\vec{T}$  acting on  $L$ , plus the numbers  $N_L$ ,  $N_R$  of left- and

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4}(\partial_\mu \vec{A}_\nu - \partial_\nu \vec{A}_\mu + g\vec{A}_\mu \times \vec{A}_\nu)^2 - \frac{1}{4}(\partial_\mu B_\nu - \partial_\nu B_\mu)^2 - \bar{R}\gamma^\mu(\partial_\mu - ig'B_\mu)R - L\gamma^\mu(\partial_\mu + ig\vec{t} \cdot \vec{A}_\mu - i\frac{1}{2}g'B_\mu)L \\ & - \frac{1}{2}|\partial_\mu \varphi - ig\vec{A}_\mu \cdot \vec{t}\varphi + i\frac{1}{2}g'B_\mu\varphi|^2 - G_e(\bar{L}\varphi R + \bar{R}\varphi^\dagger L) - M_1^2\varphi^\dagger\varphi + h(\varphi^\dagger\varphi)^2. \quad (4) \end{aligned}$$

## Standard Model Production Cross Section Measurements

Status: March 2021

**CMS Preliminary**

June 2021

Production Cross Section,  $\sigma$  [pb]

- 7 TeV CMS measurement ( $L \leq 5.0 \text{ fb}^{-1}$ )
- 8 TeV CMS measurement ( $L \leq 19.6 \text{ fb}^{-1}$ )
- 13 TeV CMS measurement ( $L \leq 137 \text{ fb}^{-1}$ )
- Theory prediction
- CMS 95%CL limits at 7, 8 and 13 TeV

All results at: <http://cern.ch/go/pNj7>

EW,Z $\gamma$ ,W $\gamma$ : fiducial with  $W \rightarrow l\nu$ ,  $Z \rightarrow ll$ ,  $l=e,\mu$

Th.  $\Delta\sigma_H$  in exp.  $\Delta\sigma$

Overall remarkable data vs. theory agreement  
➡ Precision tests of the SM at the quantum level in a multitude of processes

# With the discovery of the Higgs the SM is 'complete'

# 2→3 at NNLO

$$pp \rightarrow \gamma\gamma\gamma$$

[Chawdhry, Czakon, Mitov, Poncelet '19]

[Kallweit, Sotnikov, Wiesemann '20]

- significant NNLO/NLO corrections
- improved data/theory agreement at NNLO

$$pp \rightarrow \gamma\gamma j$$

[Chawdhry, Czakon, Mitov, Poncelet '21]

$$gg \rightarrow \gamma\gamma g$$

► [Badger, Brønnum-Hansen, Chicherin et. al. '21]

- NNLO mandatory due to large NLO/LO corrections

➡ precision probes of QCD dynamics

# pp → jjj at NNLO

"Tour de force in Quantum Chromodynamics"

[Czakon, Mitov, Poncelet '21]

- ➡ clear stabilisation of perturbative expansion at NNLO
- ➡ opens the door to  $a_s(\mu)$  determination up to TeV scale

# DY @ N3LO: inclusive

[Duhr, Dulat, Mistlberger, '20-1, '20-2]

$W^+$

- ➡ Very similar behaviour in CC and NC DY
- ➡ At large  $Q$  scale variations bands are nicely overlapping, i.e. convincing convergence of perturbative series.
- ➡ However, for  $Q < 400$  GeV NNLO and N3LO do not overlap! (Here:  $\delta\text{N3LO} \sim 1\text{-}2\%$ )
- ➡ Origin: quite large cancellation of quark and gluon initial state.

$\gamma^*$

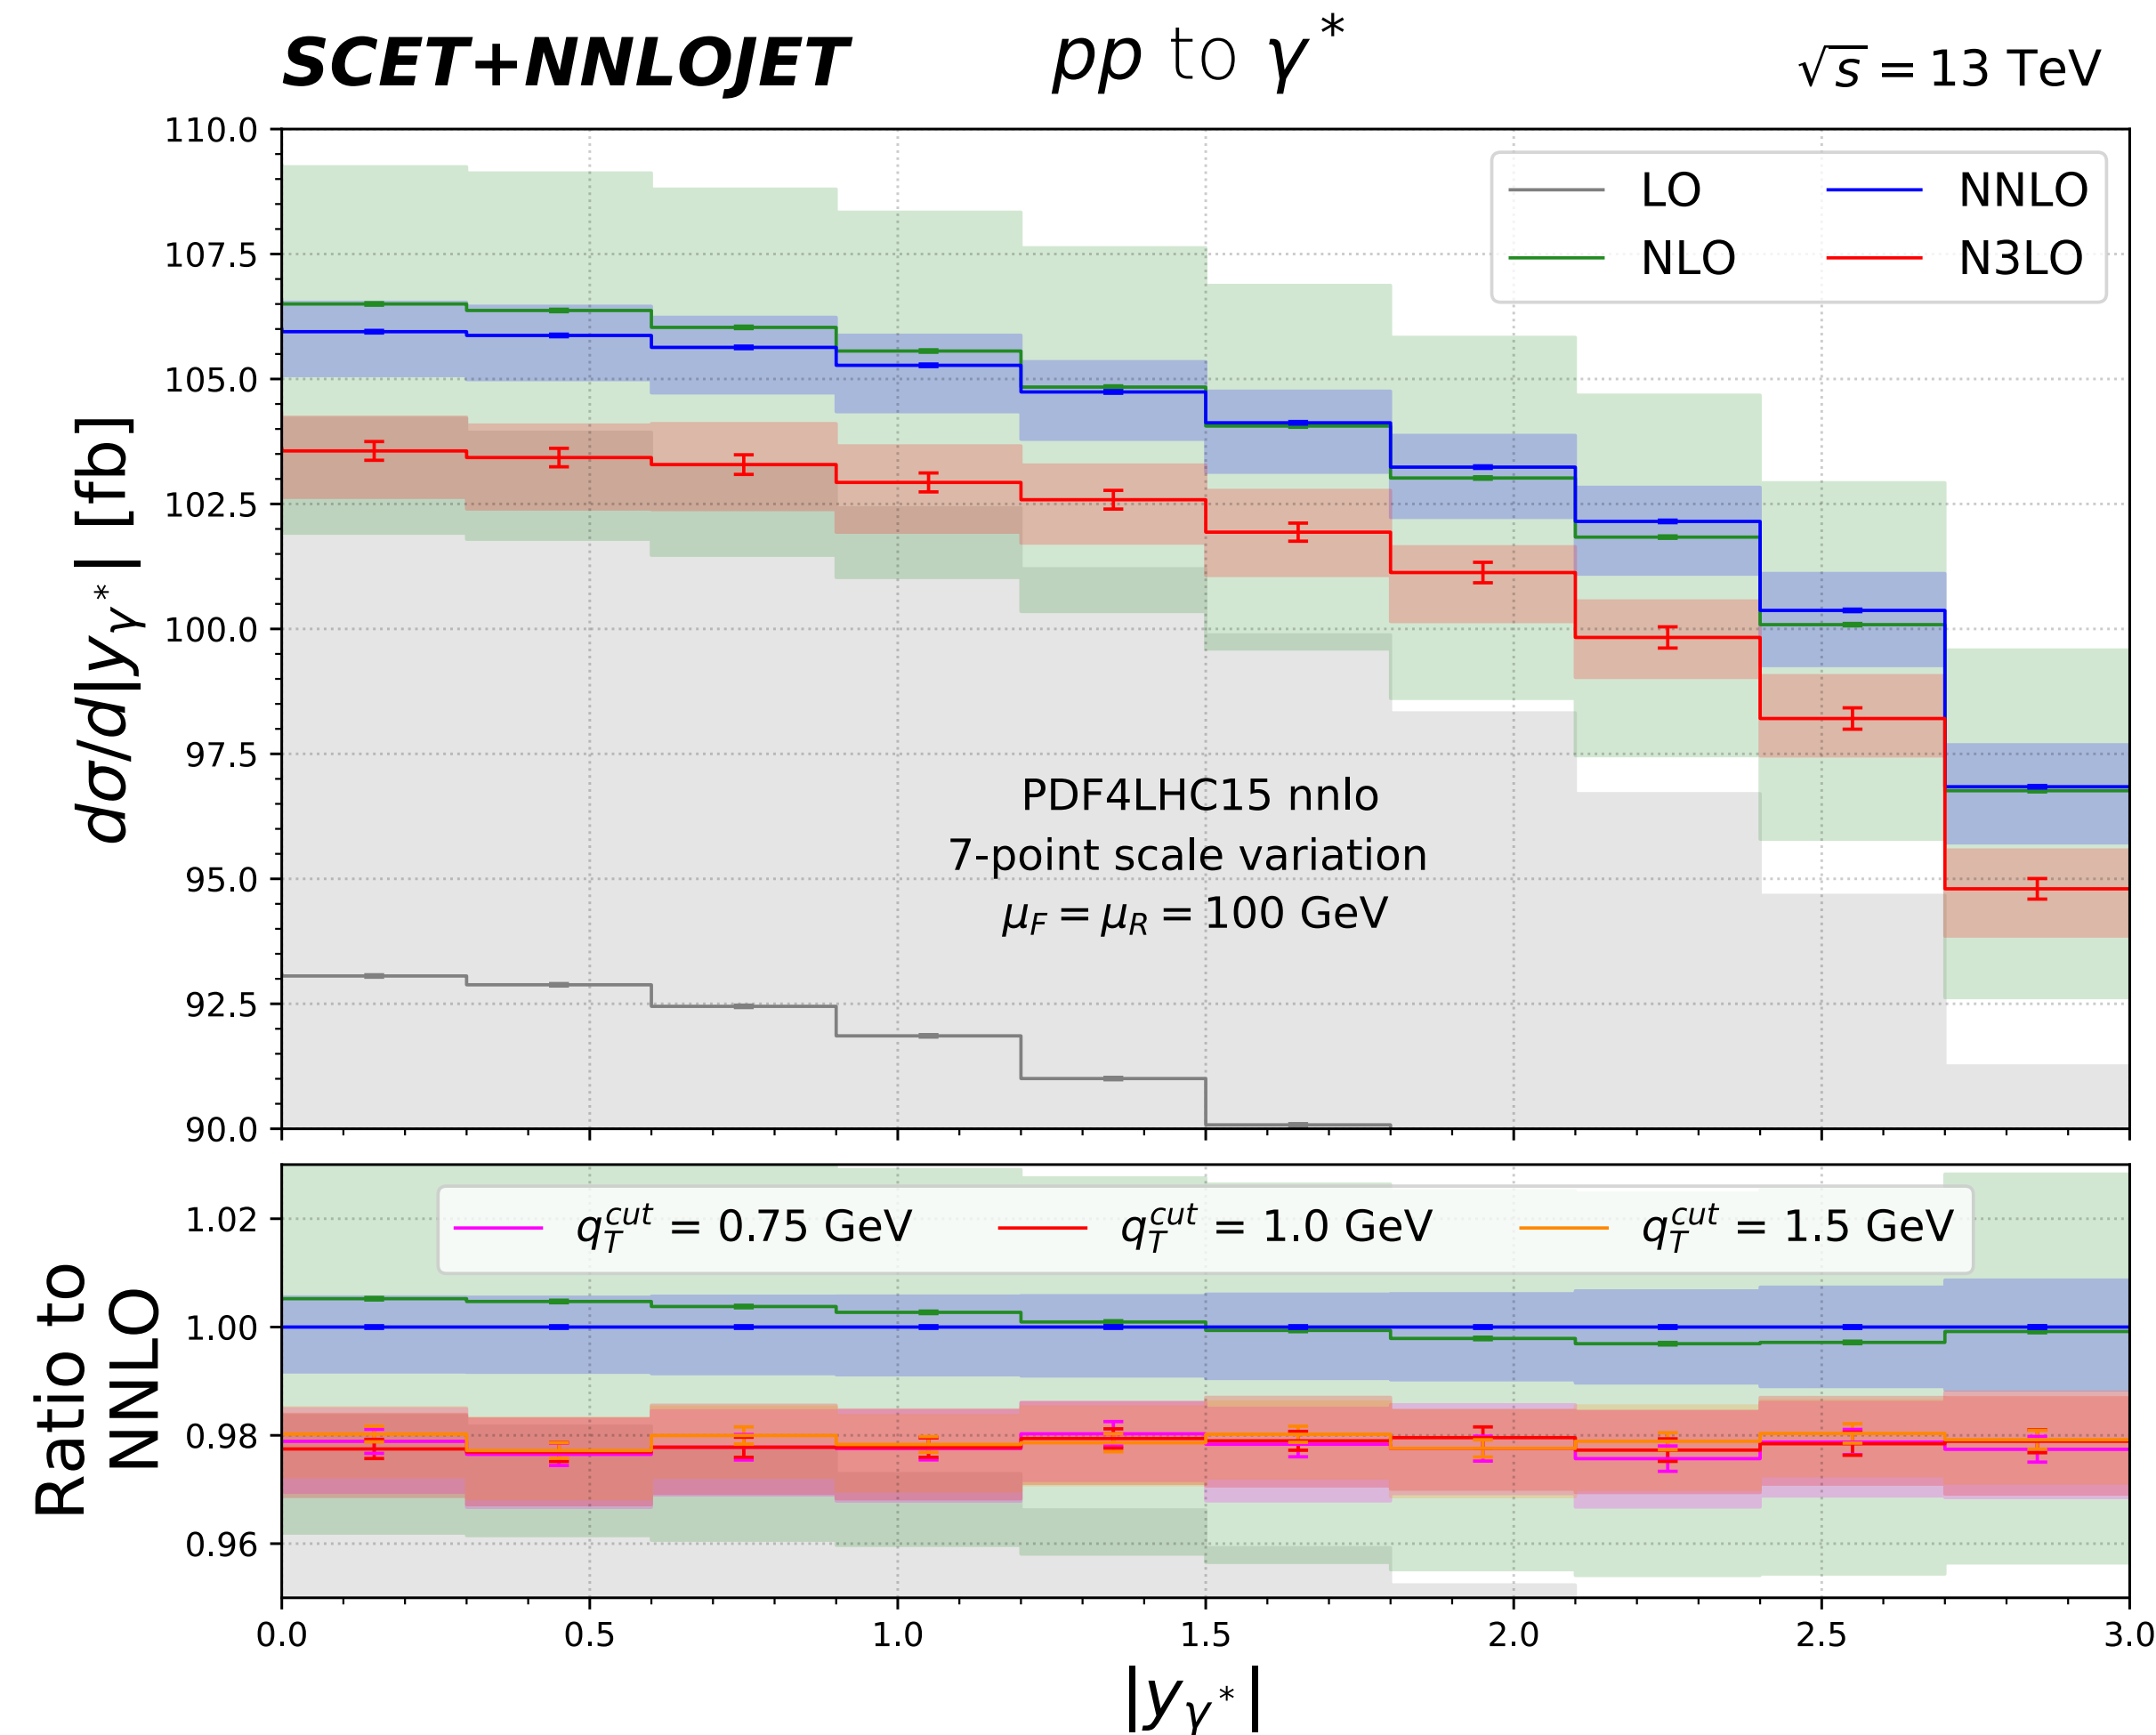

- ➡ Might be compensated by currently missing N3LO PDFs

Note: very precise measurements of high-mass DY can be used to constrain BSM, see Farina et. al. '16 (1609.08157)

# DY @ N3LO: differential

[Chen, Gehrmann, Glover, et. al., '21]

- ▶ method:  $q_T$  subtraction at N3LO:  
requires V+jet at NNLO
- ▶ N3LO/NNLO: -2% (validation of inclusive computation)
- ▶ N3LO not covered by NNLO band
- ▶ 7-pt scale variation might not be good enough to  
estimate perturbative uncertainties at the percent level.

# Theoretical Predictions for the LHC

Hard (perturbative) scattering process:

$$d\sigma = d\sigma_{\text{LO}} + \alpha_S d\sigma_{\text{NLO}} + \alpha_{\text{EW}} d\sigma_{\text{NLO EW}}$$

$$+ \alpha_S^2 d\sigma_{\text{NNLO}} + \alpha_{\text{EW}}^2 d\sigma_{\text{NNLO EW}} + \alpha_S \alpha_{\text{EW}} d\sigma_{\text{NNLO QCDxEW}}$$

$$\begin{aligned} \mathcal{L}_{SM} = & -\frac{1}{2}\partial_\nu g_\mu^a \partial_\nu g_\mu^a - g_s f^{abc} \partial_\mu g_\nu^a g_\mu^b g_\nu^c - \frac{1}{4}g_s^2 f^{abc} f^{ade} g_\mu^b g_\nu^c g_\mu^d g_\nu^e - $$\hookrightarrow |\mathcal{M}|^2 \hookrightarrow \sigma$$

# Mixed QCD-EW corrections to DY production: NC

See talk by  
Raoul Röntsch  
tomorrow  
→ impact on mW

- Complete  $O(\alpha_s \alpha)$  corrections still beyond currently technology
- For precision in resonant region: expand around  $M^2$

non-factorizable

[Dittmaier, Huss, Schwinn, '14]

*negligible*

prod x decay

[Dittmaier, Huss, Schwinn, '15]

*dominant*

genuine QCD-EW in prod

[Buccioni, Caola, Delto, Jaquier, Melnikov, Röntsch, '20]

[Behring, Buccioni, Caola, et. al. '20]

*last missing piece*

For production only

- QCD  $\times$  weak dominant over QCD  $\times$  QED
- net effect: few per-mille

NC

—  $\text{QCD}^2 / 10$  —  $\text{QCD} \times \text{QED}$  —  $\text{QCD} \times \text{weak}$  —  $\left\{ \begin{array}{c} + \\ - \end{array} \right\}$

# Mixed QCD-EW corrections to NC-DY production: beyond the pole approximation

[Bonciani, Buonocore, Grazzini, Kallweit et. al. '21]

See talks by  
Luca Buonocore  
tomorrow

- Comparison against naive factorised NLO QCD  $\times$  NLO EW ansatz: fail at the 5-10% level
- pole approximation vs. full computation: agree below the percent level

# Top-quark spin correlations at NNLO

[Czakon, Mitov, Poncelet '20]

$$pp \rightarrow t\bar{t} \rightarrow 2\ell 2\nu b\bar{b}$$

- Small corrections and uncertainties in leptonic observables
- Excellent data-theory agreement

- Might allow for an additional handle on  $M_{\text{top}}$
- Need to understand systematics at small  $m_{\ell\bar{\ell}}$  (EW corrections, finite width effects, ...)

# Top-quark spin correlations at NNLO

[Czakon, Mitov, Poncelet `20]

$$pp \rightarrow t\bar{t} \rightarrow 2\ell 2\nu b\bar{b}$$

- Small corrections and uncertainties in leptonic observables
- Excellent data-theory agreement

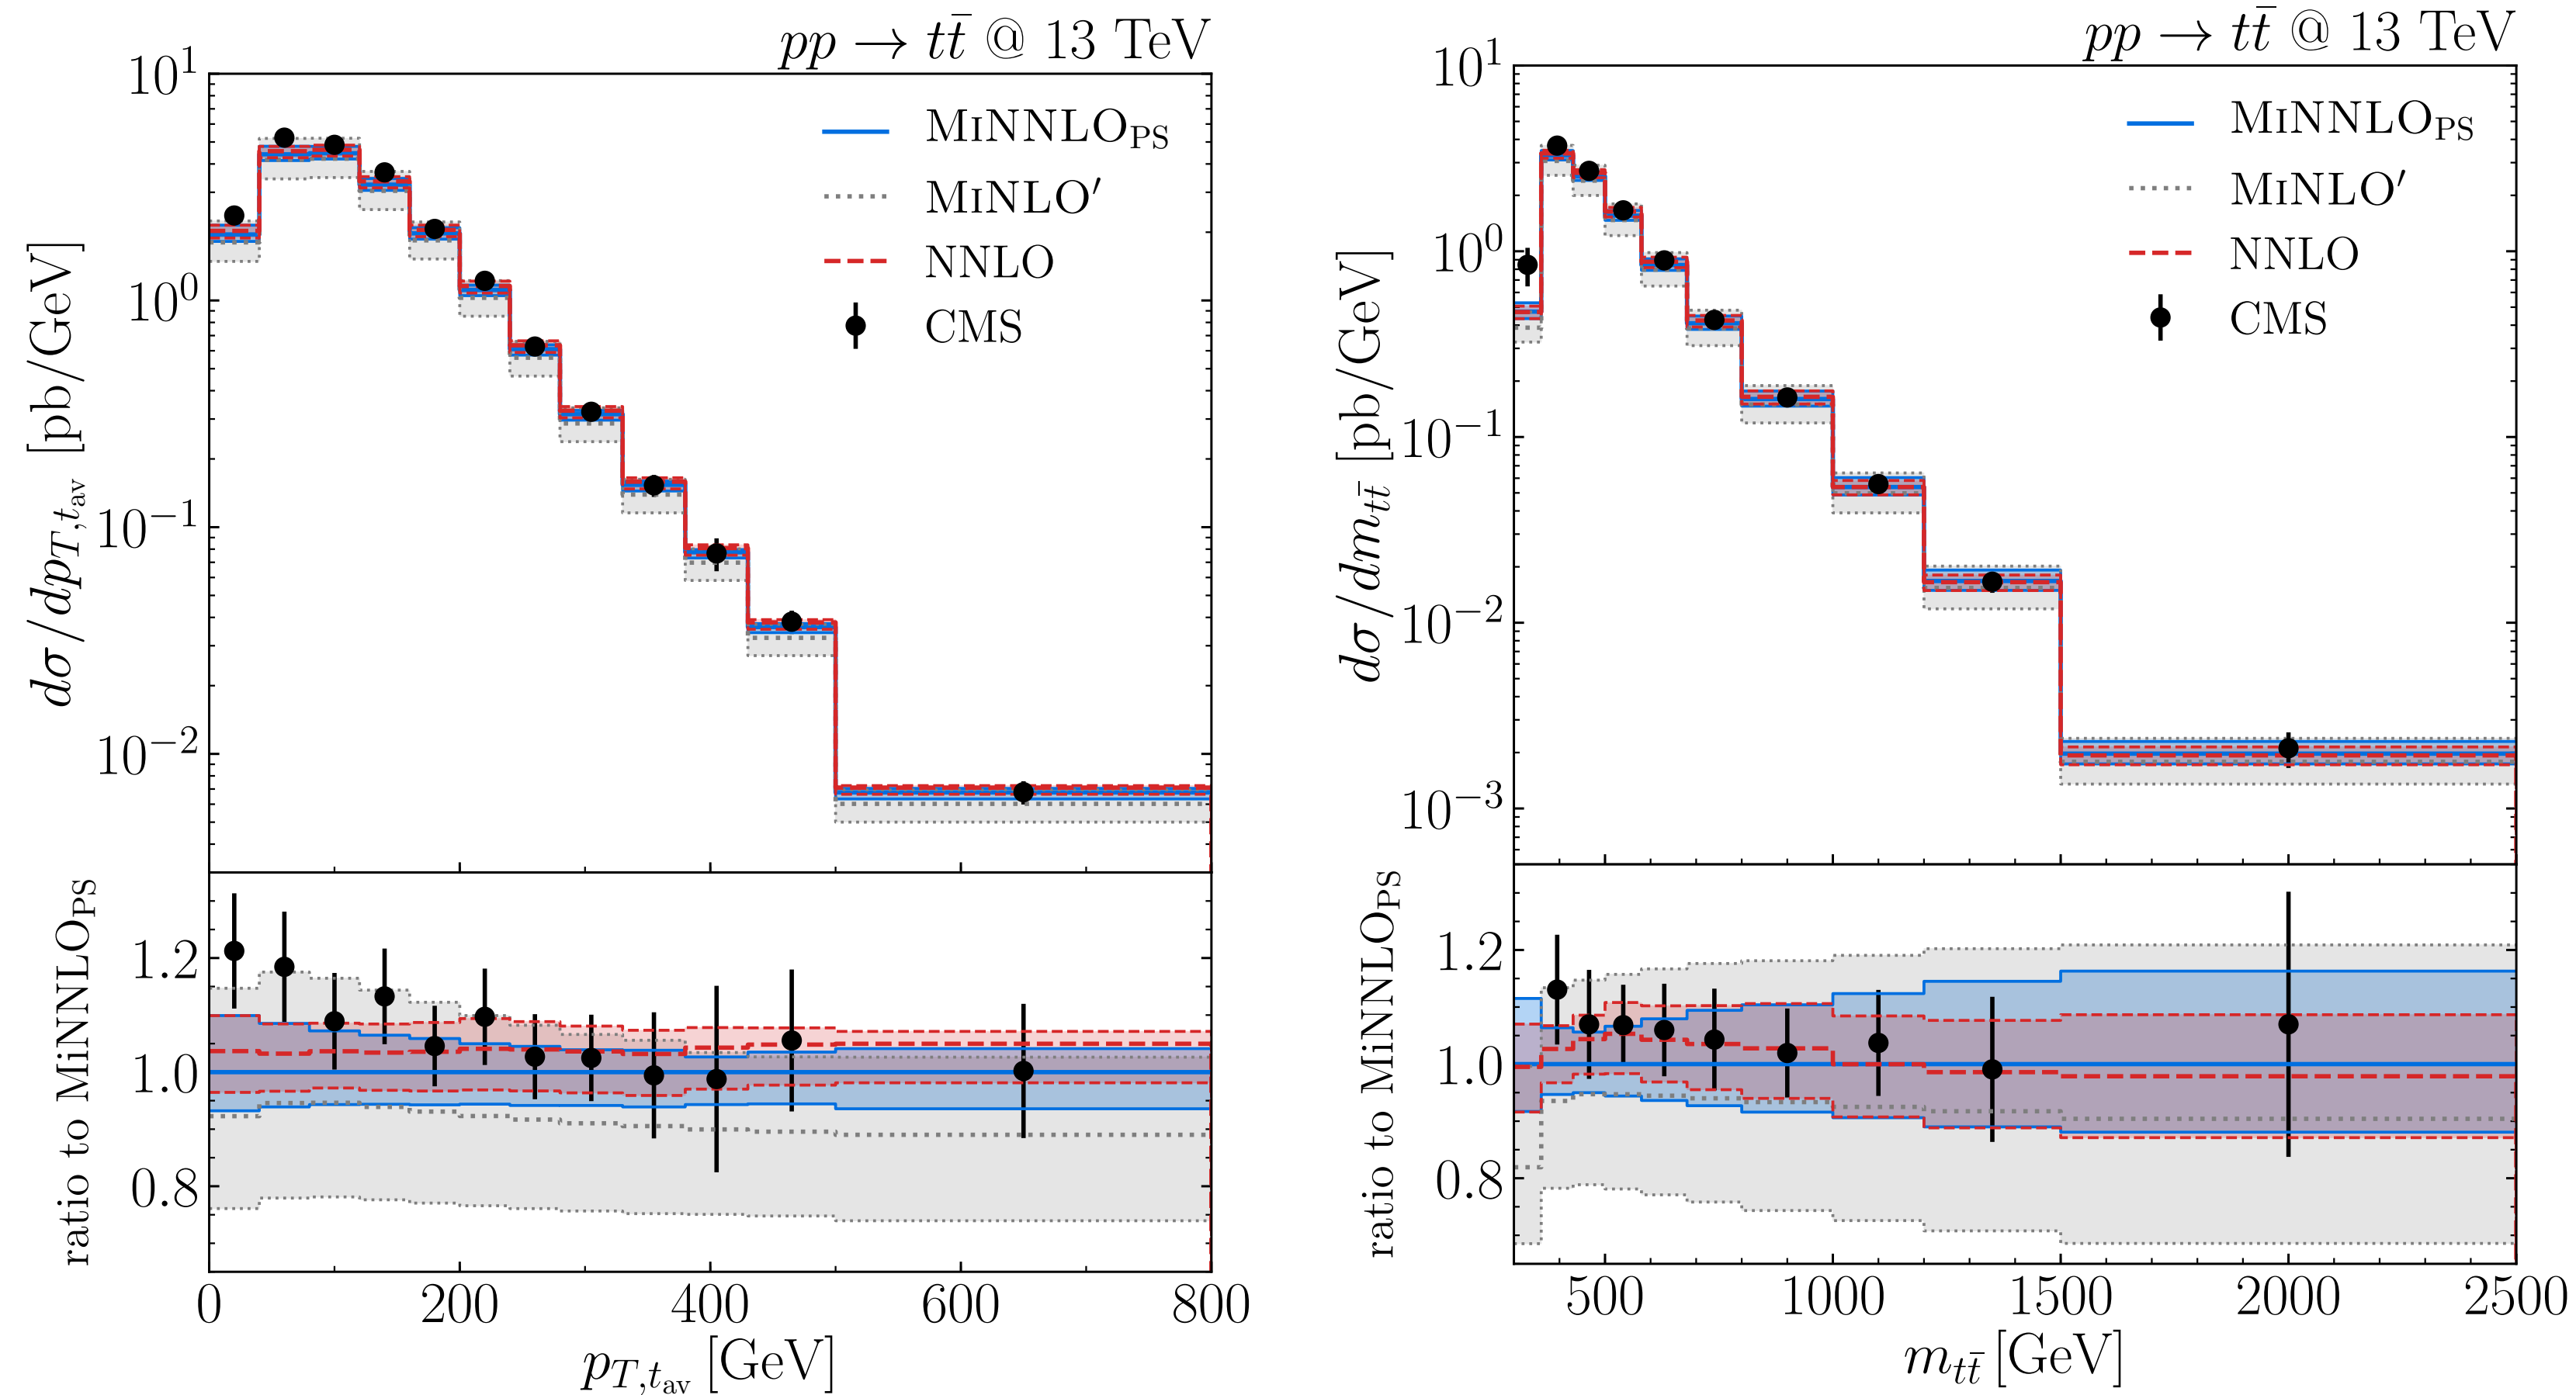

- Might allow for an additional handle on  $M_{\text{top}}$
- Need to understand systematics at small  $m_{\ell\bar{\ell}}$  (EW corrections, finite width effects, ...)

# Top-quark pair production at NNLO+PS

[Mazzitelli, Monni, Nason, Re, Wiesemann, Zanderighi '20]

See talk by  
Javier Mazzitelli  
yesterday

- Requires highly non-trivial extension of MiNNLOPS method to final state radiation
- Very good agreement between MiNNLOPS and NNLO (and comparable uncertainties)
- NNLO accuracy mandatory given data accuracy

# $t\bar{t}b\bar{b}$ x decays @ NLO: precision for the highest multiplicities

[Denner, Lang, Pellen '20]

[Bevilacqua, Bi, Hartanto, Kraus, Lupattelli, Worek, '21]

- Thorough understanding of theory systematics in this channel crucial for  $t\bar{t}H$  measurements where  $H \rightarrow b\bar{b}$
- $t\bar{t}b\bar{b}$  receives sizeable QCD corrections
- Very important confirmation of  $(t\bar{t}b\bar{b})$  double pole approximation

# NLO+PS for $gg \rightarrow VV/H \rightarrow 4l$

[Alioli, Ferrario Ravasio, JML, Röntschi, '21]

$gg \rightarrow VV \rightarrow 4l$

$gg \rightarrow H \rightarrow 4l$

- $ggVV/ggZZ$  @ NLO QCD + PS available!
- crucial for off-shell Higgs measurements

# Conclusions

- ▶ There is no clear scale/signature for new physics effects:  
Let's explore the unknown leaving no stone unturned!
- ▶ Precision is key for SM (QCD/EW/Higgs) measurements,  
SM parameter determination, as well as for BSM searches.
- ▶ First  $2 \rightarrow 3$  NNLO results are becoming available.
- ▶ N3LO for some  $2 \rightarrow 2$  processes within reach
- ▶ At the 1% level a multitude of relevant effects might play  
an important role:  
PDFs, EW, QCD-EW, resummation/PS, off-shell/finite width...
- ▶ Let's push the SM precision frontier!

# Theory frontier

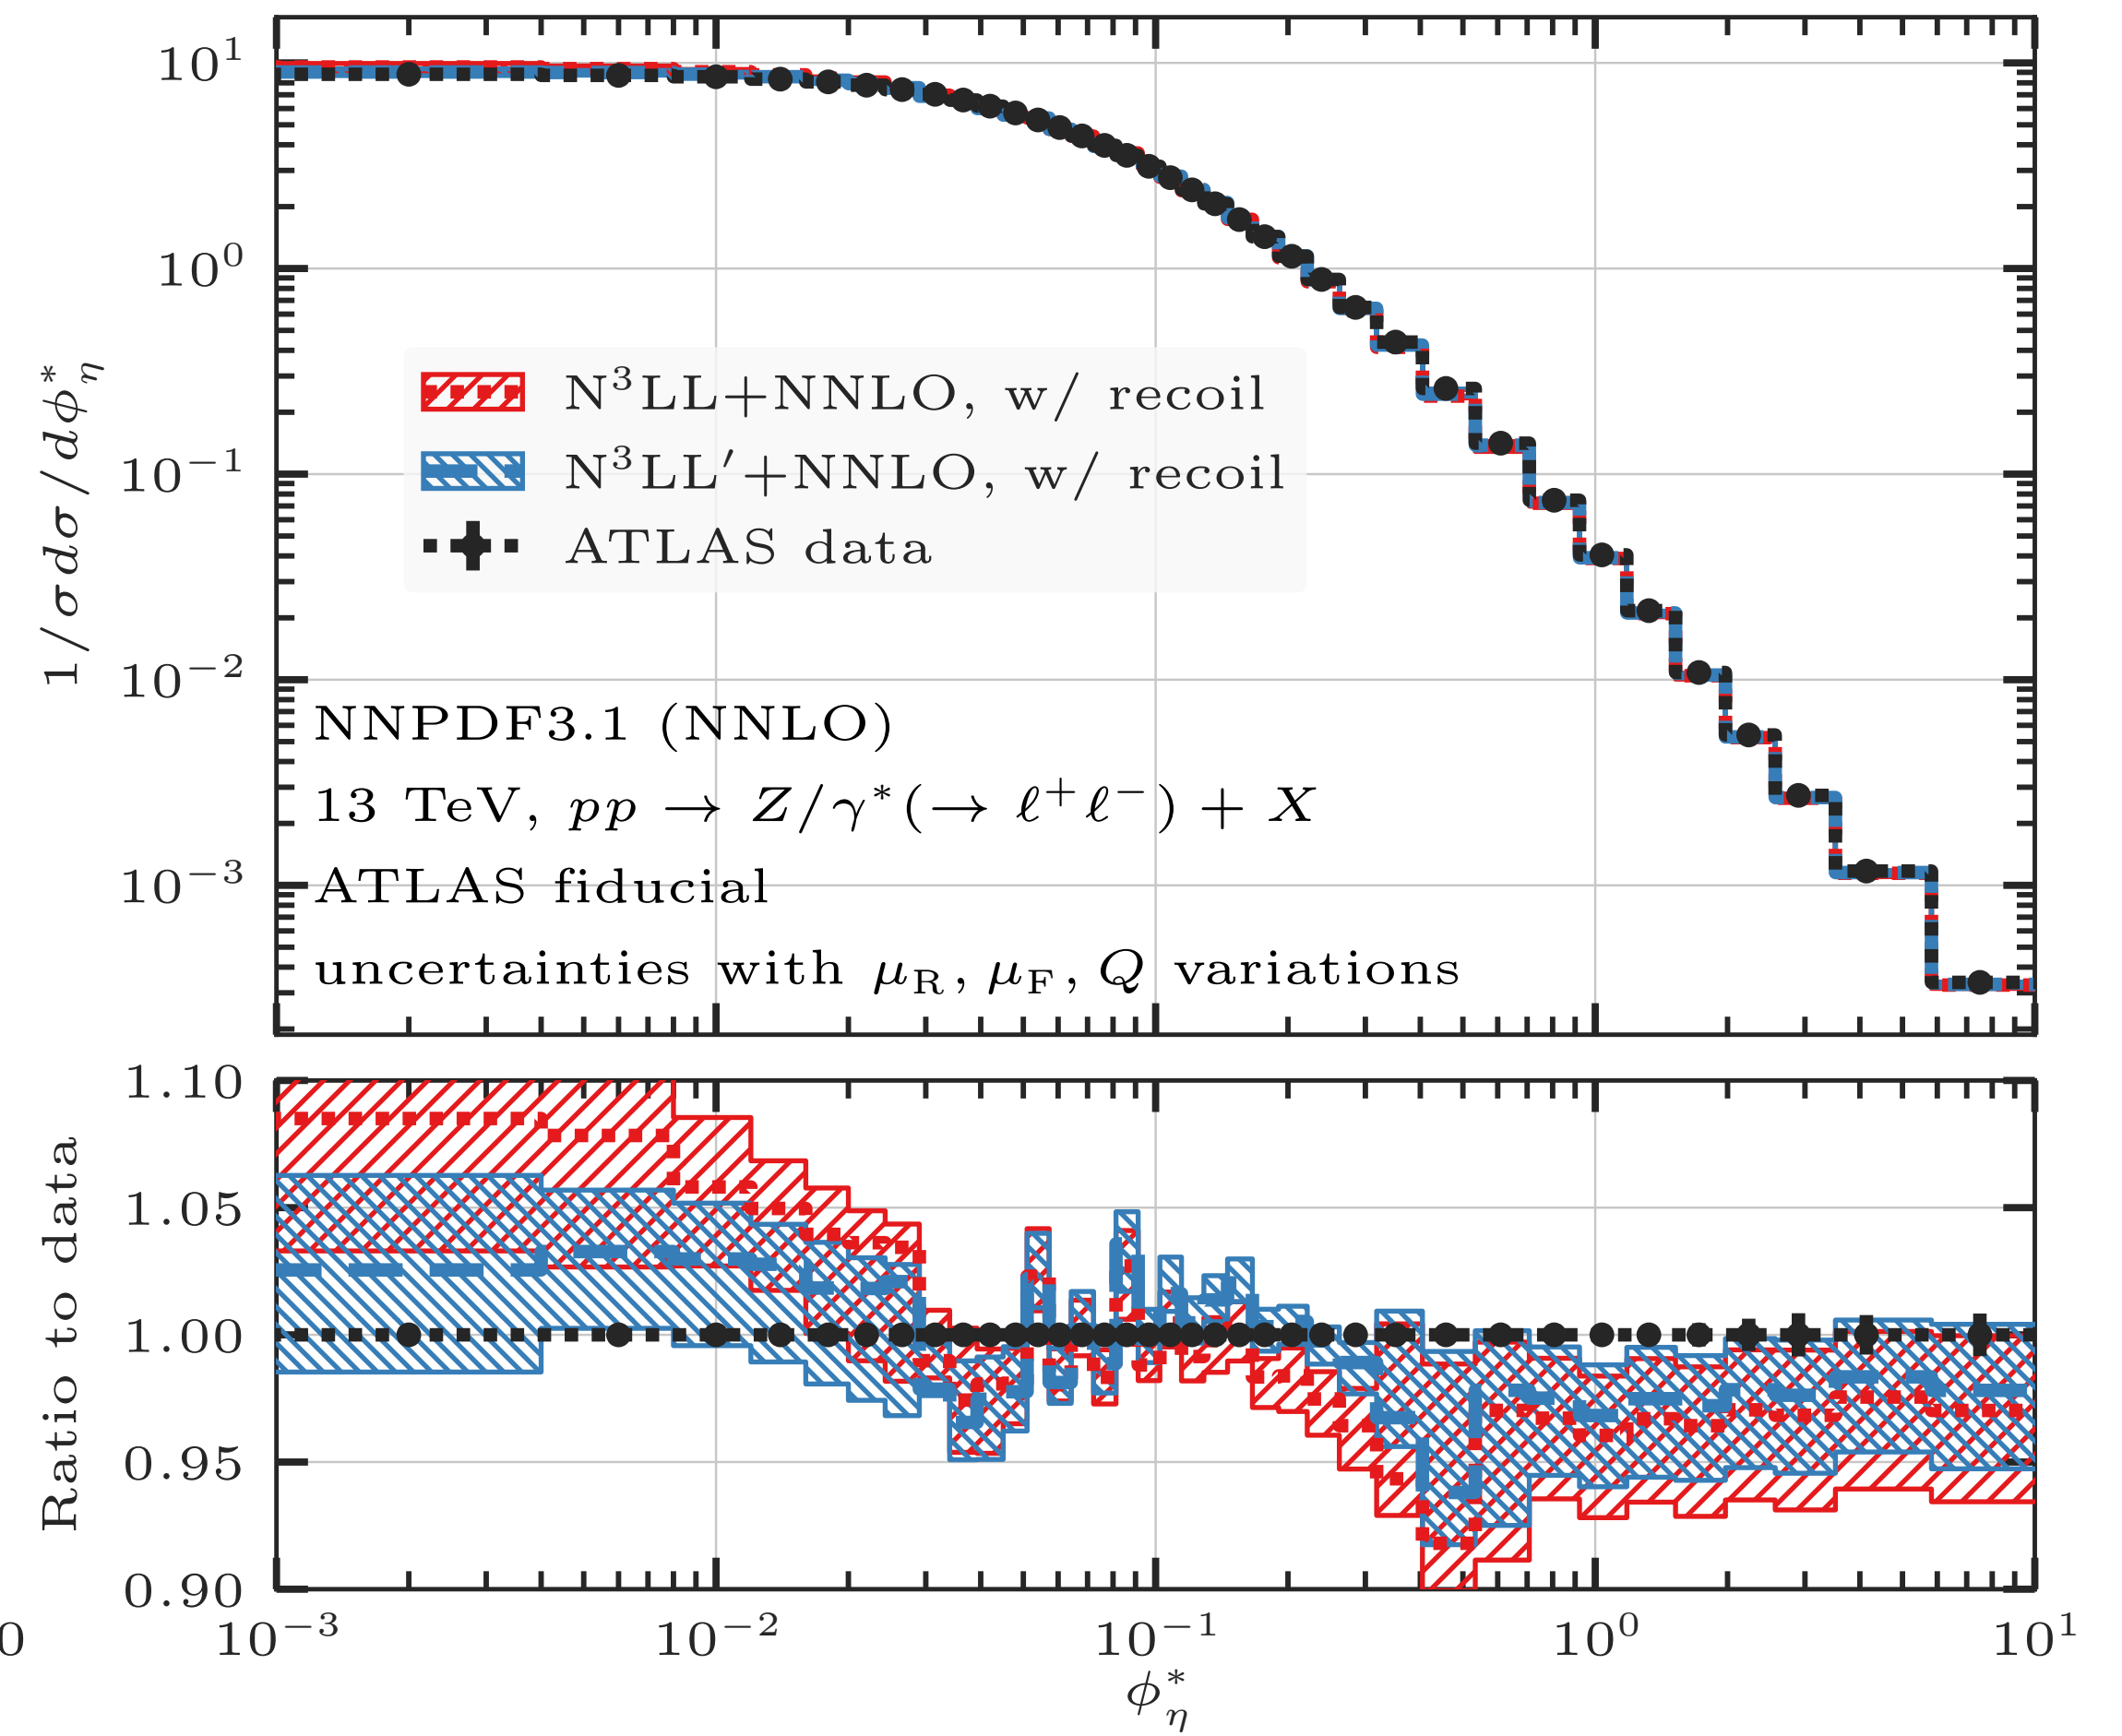

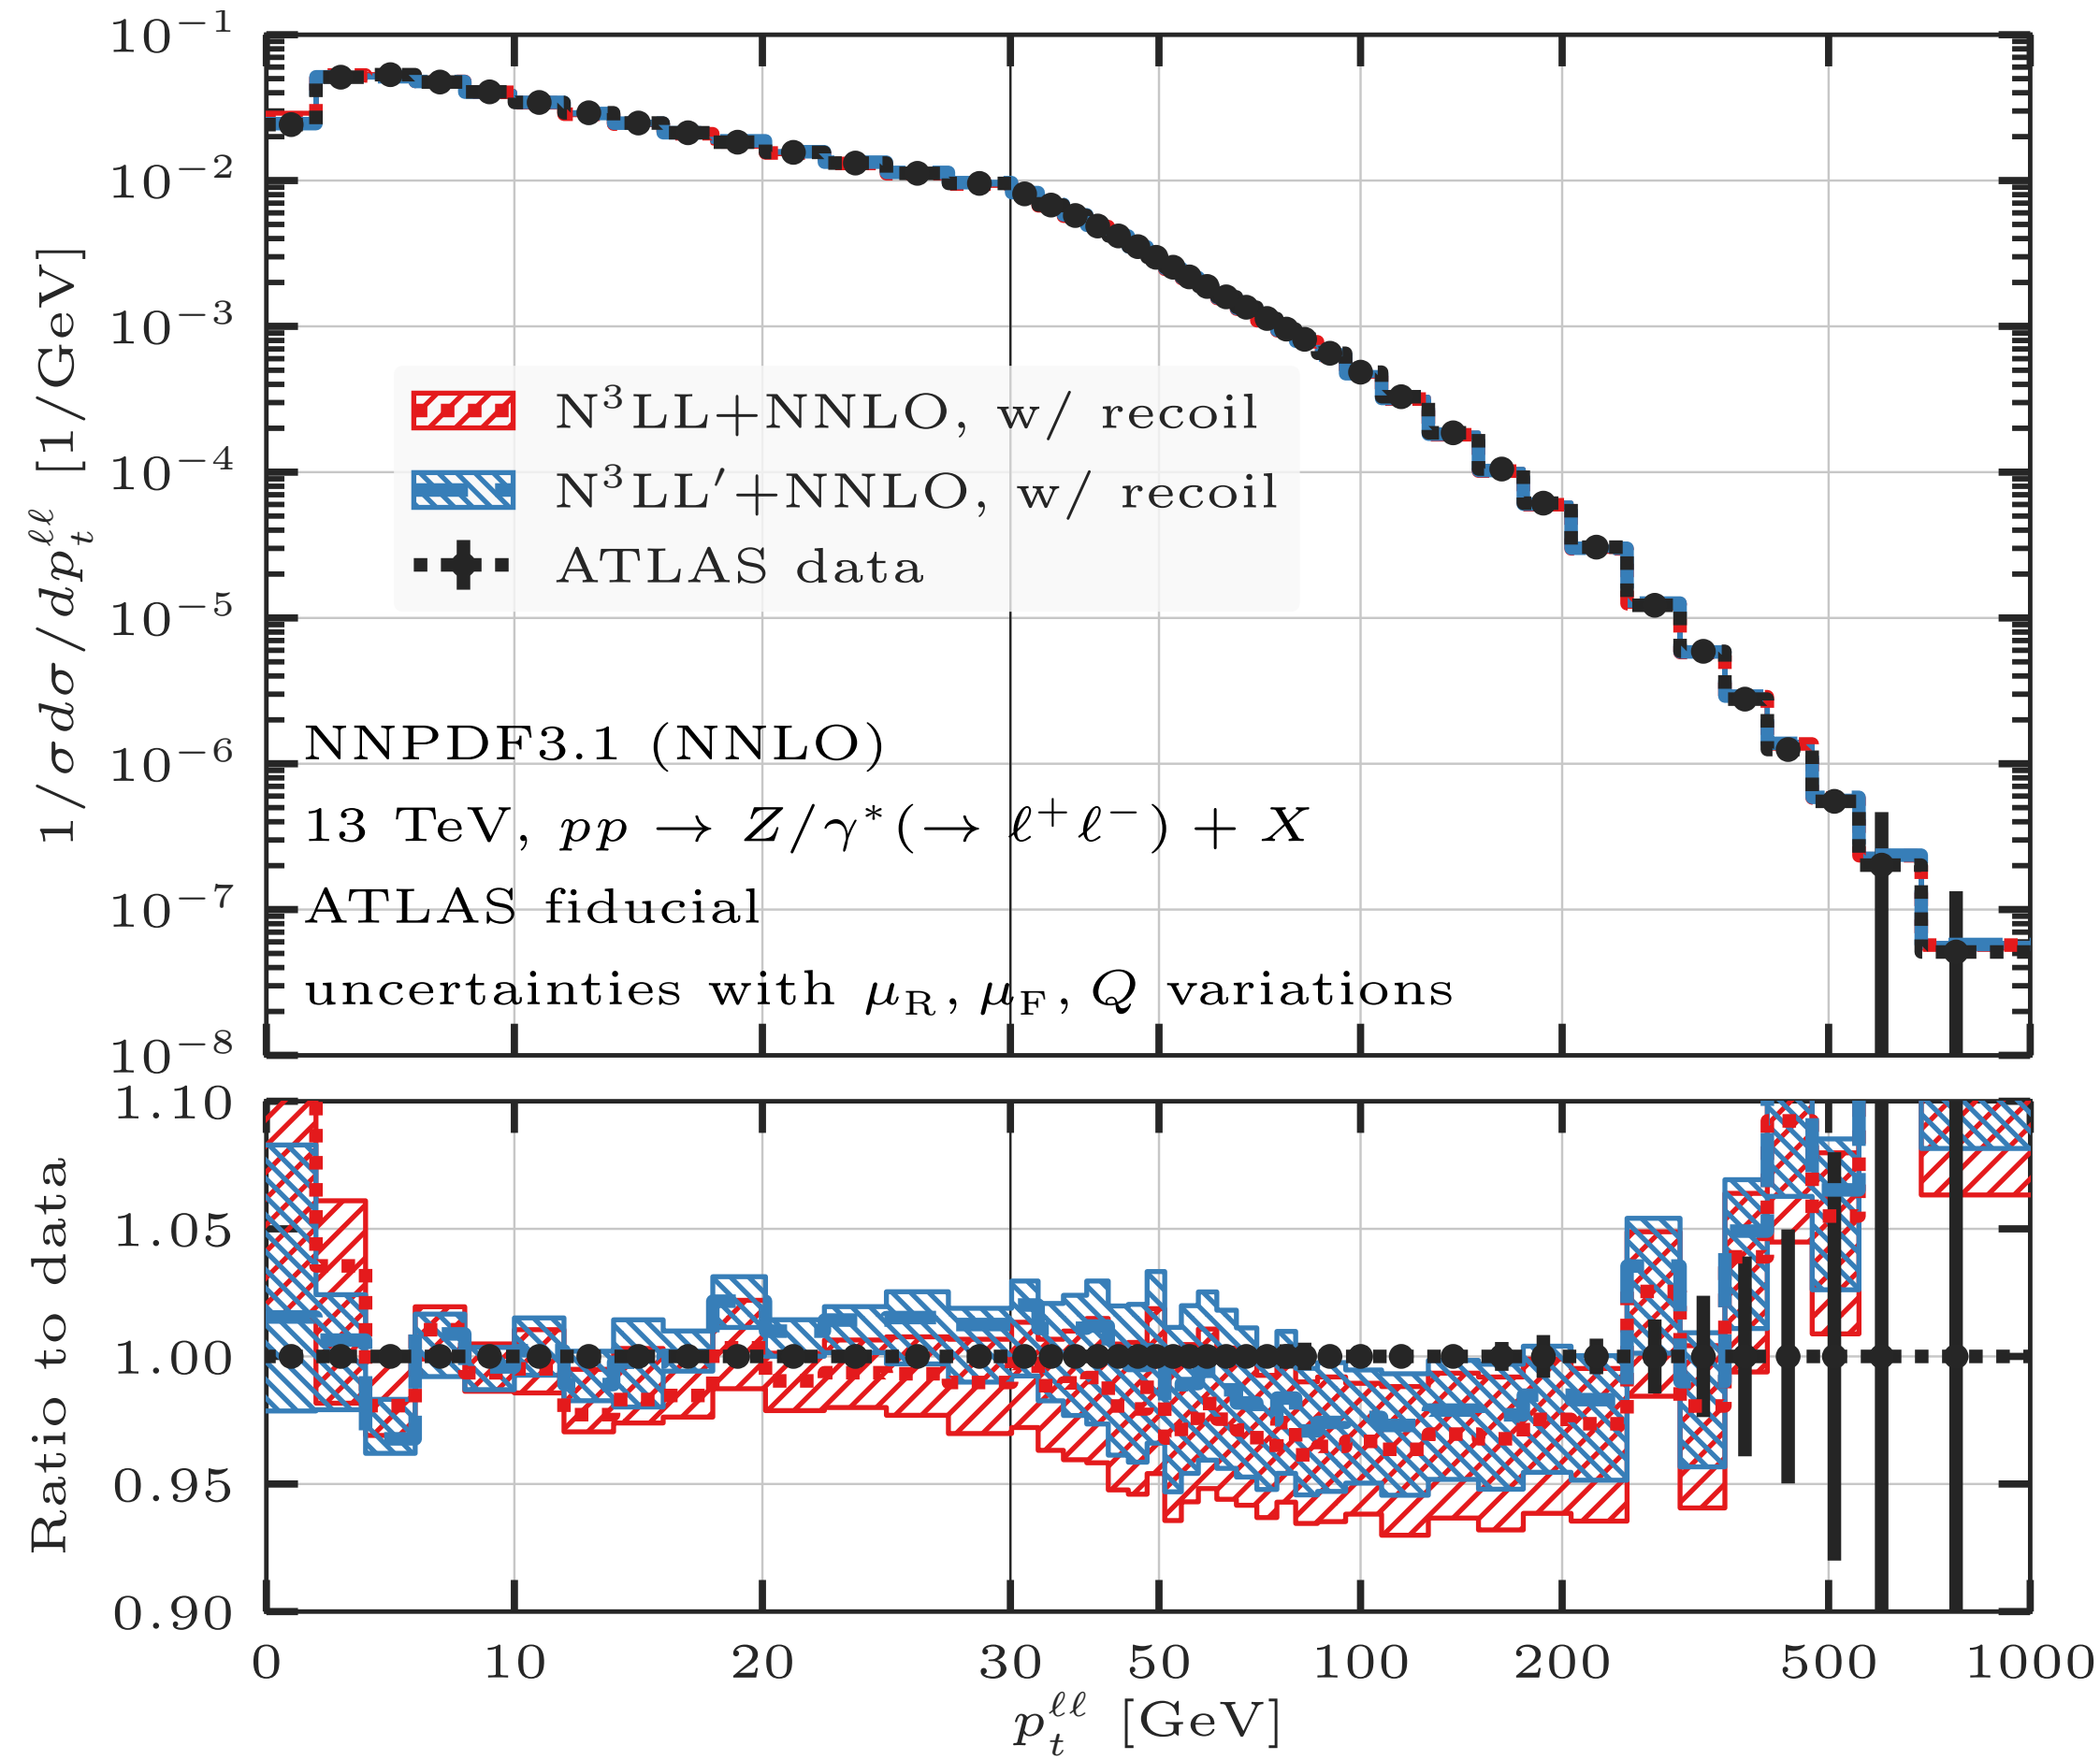

BACKUP

# DY at finite pT at NNLO+N3LL'

[E. Re, L. Rottoli, P. Torrielli; 2104.07509]

- O(5%) shift due to “” (finite  $\alpha_S^3$  contributions)
- remarkable theory with data agreement at the few% level

# EW ZZ+2jets @ NLO QCD + EW

[A. Denner, R. Franken, M. Pellen, T. Schmidt; '20]

QCD and EW ss-WWjj at NLO QCD+EW: [Biedermann, Denner, Pellen '16+'17]

EW WZjj at NLO QCD+EW: [Denner, Dittmaier, Maierhöfer, Pellen, Schwan, '19]

• 2  $\rightarrow$  6 particles at NLO EW !

Order	$\mathcal{O}(\alpha^6) + \mathcal{O}(\alpha^7)$	$\mathcal{O}(\alpha^6) + \mathcal{O}(\alpha_s \alpha^6)$	$\mathcal{O}(\alpha^6) + \mathcal{O}(\alpha^7) + \mathcal{O}(\alpha_s \alpha^6)$
<hr/> $M_{j_1j_2} > 100 \text{ GeV}$ <hr/>			
$\sigma_{\text{NLO}} [\text{fb}]$	0.08211(4)	0.12078(11)	0.10521(11)
$\delta [\%]$	-15.9	23.6	7.7
<hr/> $M_{j_1j_2} > 500 \text{ GeV}$ <hr/>

$\delta [\%]$	-17.6	0.1	-17.5

• In the VBS phase-space EW mode receives:

- ▶ very small QCD corrections (percent level)
- ▶ O(20%) EW corrections

# The motivation for BSM searches are as compelling as ever

EW vacuum stability

Dark Matter

GUT unification

Neutrino masses

Hierarchy problem

$$m_h^2 = (m_h^0)^2 + \frac{3\Lambda_{UV}^2}{8\pi v^2} (m_h^2 + 2m_W^2 + m_Z^2 - 4m_t^2)$$

# Direct searches for new physics: overwhelming SM backgrounds

vs.

Thanks to state-of-the-art  
 theory predictions+uncertainties  
 for SM backgrounds  
 [JML, et.al., '17]

few percent!

→ Theory precision is key to harness full potential of LHC data!

# Indirect searches: disentangling very small effects

e.g.

Look for BSM effects in small deviations from SM predictions:

→ Higgs processes natural place to look at

→ **very good control on theory necessary!**

→ Theory precision opens the door to new analysis strategies!

From a pheno perspective finding the Higgs was “easy” ...

- Higgs at 125 GeV allowed for very clean discovery in  $\gamma\gamma$  & 4l channels

- Bump hunting: little to no theoretical input needed.

...understanding the Higgs and its properties is tough!

Is the S(125 GeV) really the SM Higgs?

- CP properties? Is there a small CP-odd admixture?
- Precise couplings with vector-bosons/fermions as in SM?
- what is the Higgs width? Is there a significant invisible decay?
- only one Higgs doublet?
- what is the Higgs potential? self-coupling?

➡ the hunt to pin down the SM has just started.

➡ precision is key!

# Theoretical Predictions for the LHC

$$d\sigma_{\text{NLO}} = \frac{1}{2s} \int d\Phi_n \left[ |\mathcal{M}_{\text{LO}}|^2 + 2\text{Re}\{\mathcal{M}_{\text{LO}}\mathcal{M}_{\text{NLO},\text{V}}^*\} + I \right] + \frac{1}{2s} \int d\Phi_{n+1} |\mathcal{M}_{\text{NLO},\text{R}}|^2 - S$$

General solution to “NLO problem” exist since long time:

- tensor reduction (since 1970s)
- IR subtraction methods (since 1990s)

However: for a long time one-loop amplitudes bottleneck due to exploding algebraic expressions for multi-particle processes ( $2 \rightarrow 4,5,6$ )

NLO Revolution (last ~20years):

- radically new approaches: on-shell methods, OPP reduction, recursion-relations at NLO...
- automation of one-loop algorithms (BlackHat, CutTools, Collier, GoSam, HELAC 1-loop, MadLoop, NGluon, **OpenLoops**, Recola, Samurai, Ninja,...) and NLO MCs (MadGraph\_aMC@NLO, Sherpa, POWHEG,...)
- vast range of multi-particle NLO predictions at LHC  
( $pp \rightarrow 5j, W + 5j, H + 3j, WWjj, WZjj, \Upsilon\Upsilon + 3j, W\Upsilon\Upsilon j, WWbb(+\text{jet}), bbbb, ttbb, ttjj, tttt, \dots$ )
- Recent important achievement: extension to NLO EW (Sherpa+OpenLoops/Recola and MadGraph\_aMC@NLO)

→ Opened the door for very detailed pheno analyses.

→ Still room for important improvements: speed, stability, flexibility.

# Convergence of the perturbative expansion: inclusive Higgs

- ➡ Error estimate at LO largely underestimated!
- ➡ N3LO  $\sim 2$  LO
- ➡ Higher-orders are crucial for reliable predictions and precision tests of Higgs properties

# Convergence of the perturbative expansion: inclusive Higgs up to N3LO

➡ At this level: crucial to investigate any possible uncertainty beyond naive scale variations

# The need for precision in tails

- many effective BSM operators yield growth with energy
  - expect small deviations in high energy shapes of distributions
  - **very good control on SM predictions necessary!**

# Relevance of EW higher-order corrections I

Numerically  $\mathcal{O}(\alpha) \sim \mathcal{O}(\alpha_s^2) \Rightarrow$  **NLO EW  $\sim$  NNLO QCD**

I. Possible large (negative) enhancement due to soft/collinear **logs** from virtual EW gauge bosons:

[Ciafaloni, Comelli, '98;  
Lipatov, Fadin, Martin, Melles, '99;  
Kuehen, Penin, Smirnov, '99;  
Denner, Pozzorini, '00]

Universality and factorisation: [Denner, Pozzorini; '01]

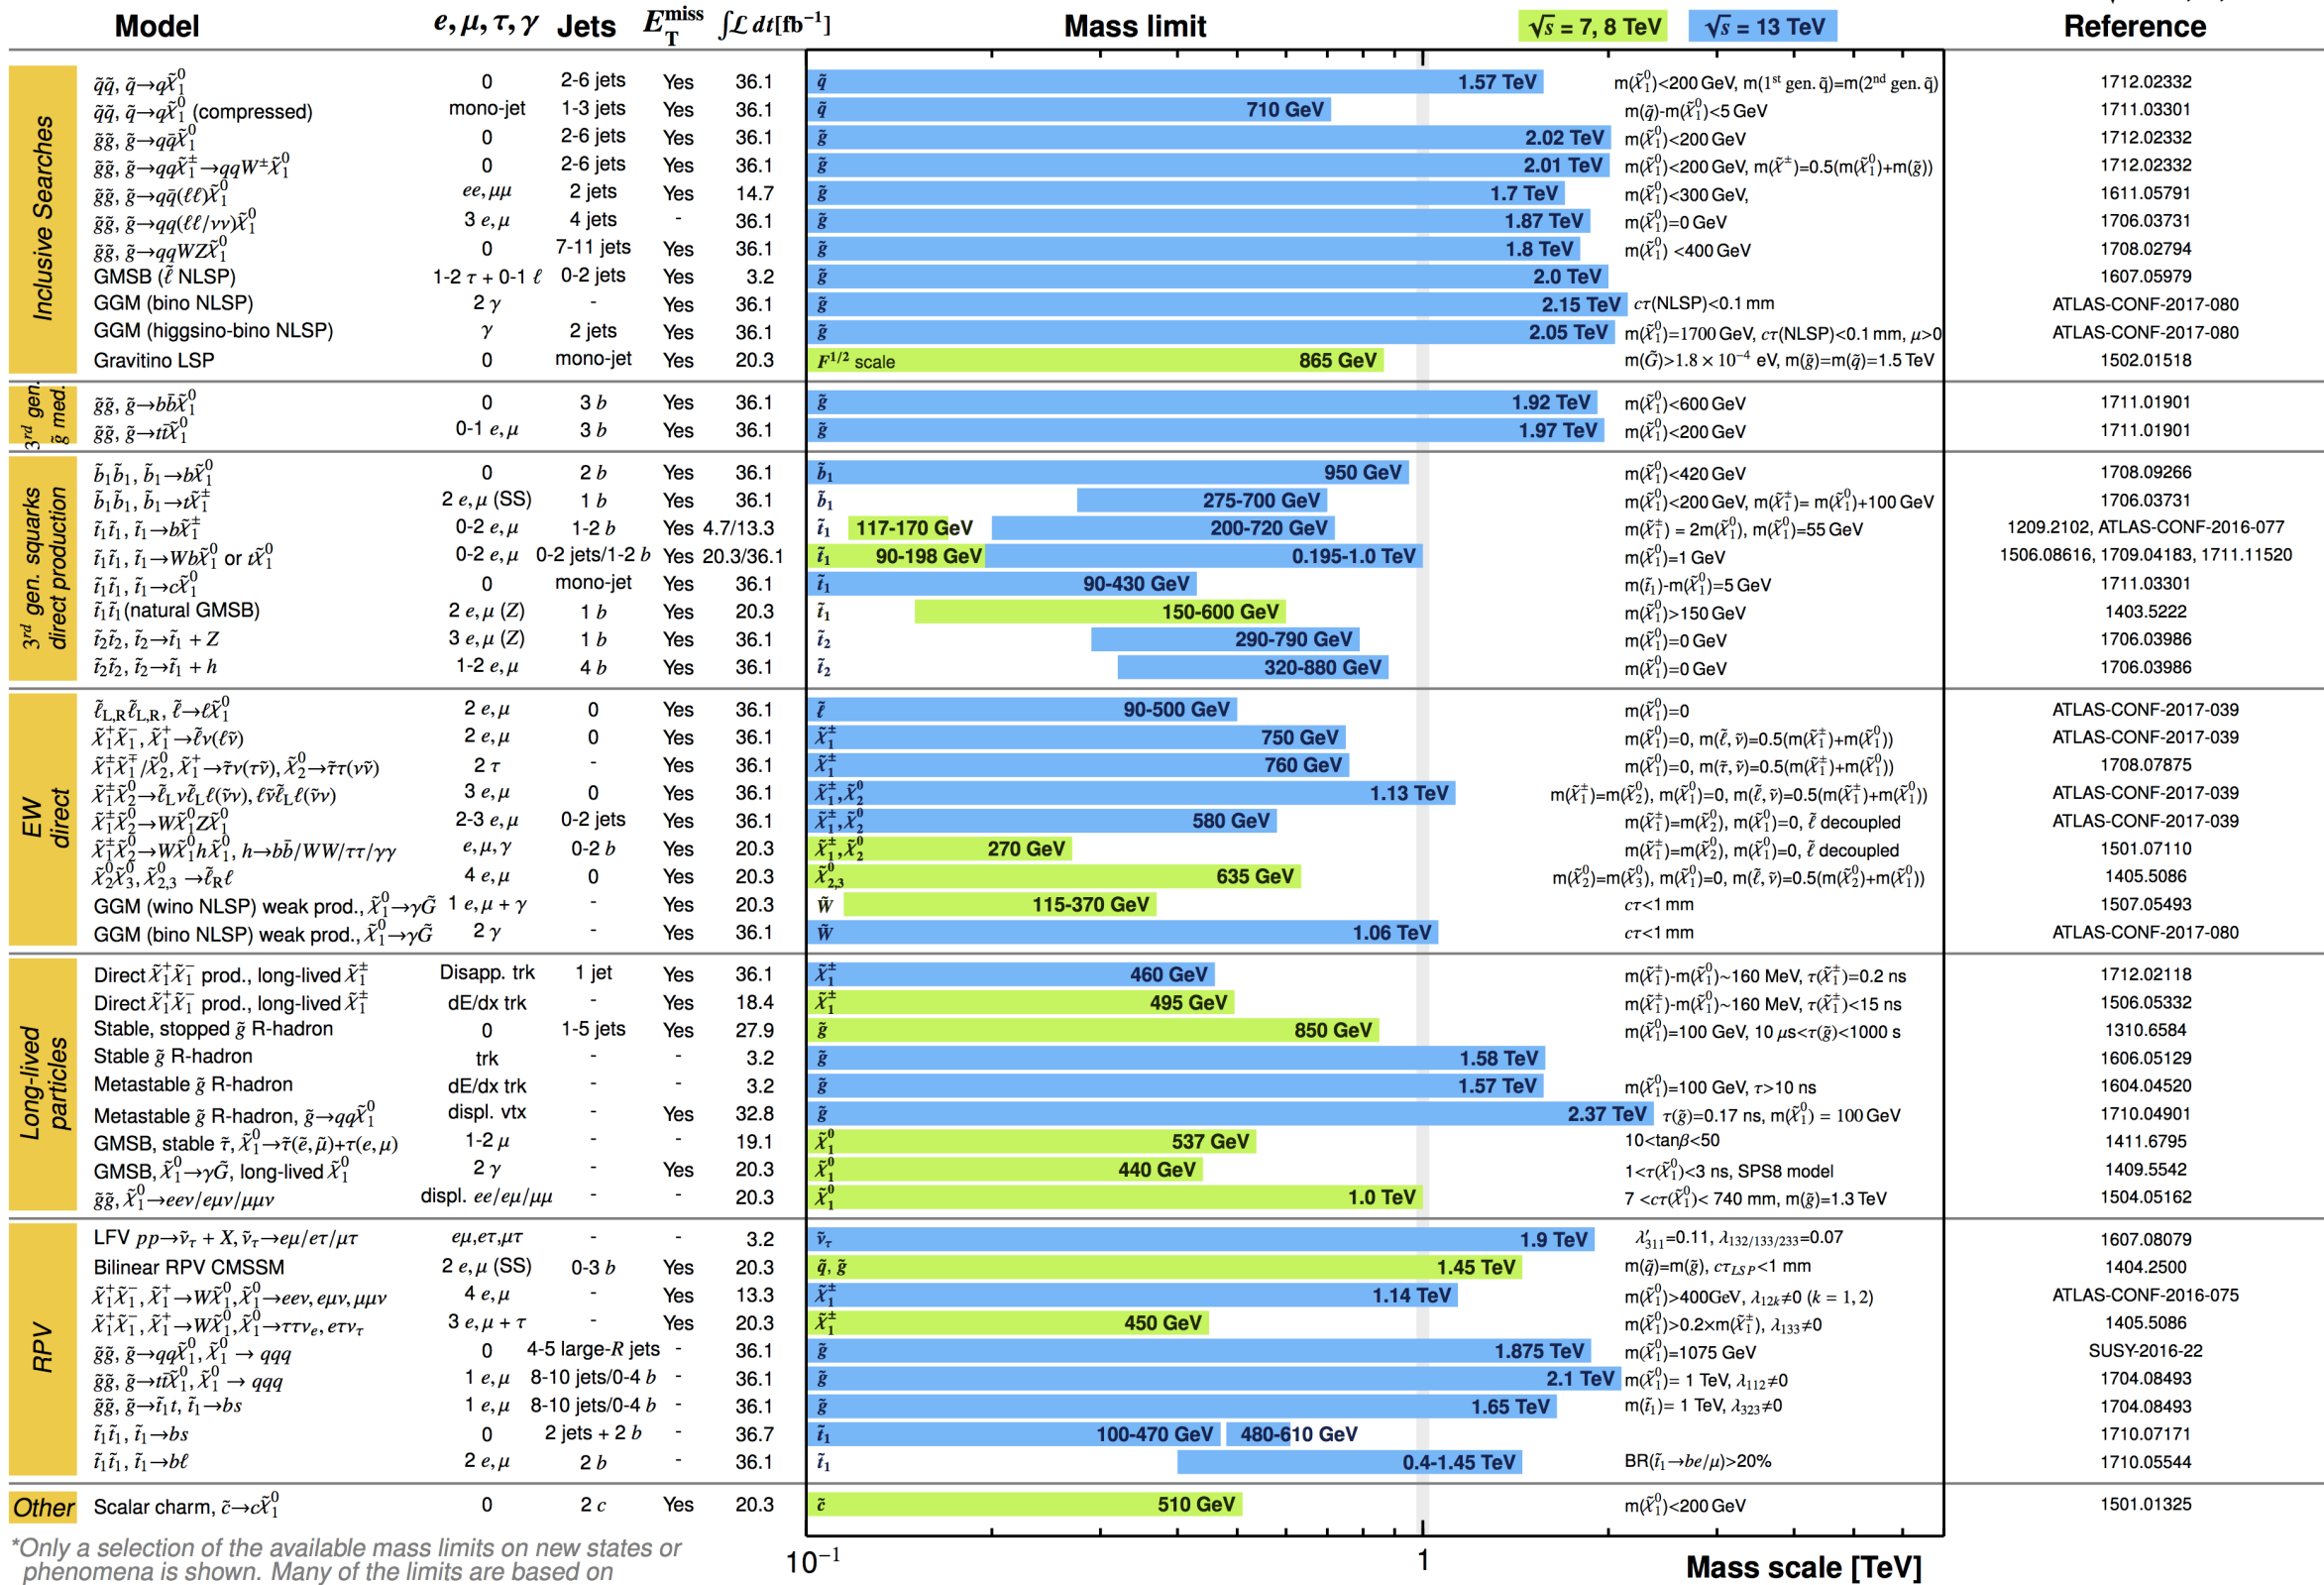

$$\delta \mathcal{M}_{\text{LL+NLL}}^{1\text{-loop}} = \frac{\alpha}{4\pi} \sum_{k=1}^n \left\{ \frac{1}{2} \sum_{l \neq k} \sum_{a=\gamma, Z, W^{\pm}} I^a(k) I^{\bar{a}}(l) \ln^2 \frac{\hat{s}_{kl}}{M^2} + \gamma^{\text{ew}}(k) \ln \frac{\hat{s}}{M^2} \right\} \mathcal{M}_0$$

→ overall large effect in the tails of distributions:  $p_T, m_{\text{inv}}, H_T, \dots$  (relevant for BSM searches!)

# Search limits

## ATLAS SUSY Searches\* - 95% CL Lower Limits

December 2017

\*Only a selection of the available mass limits on new states or phenomena is shown. Many of the limits are based on simplified models, c.f. refs. for the assumptions made.

## ATLAS Preliminary

$\sqrt{s} = 7, 8, 13 \text{ TeV}$

## ATLAS Exotics Searches\* - 95% CL Upper Exclusion Limits
