Conclusions and Outlook

Introduction and motivations

- Heavy-flavored emissions in hadronic and lepto-hadronic collisions are commonly recognized as excellent probe channels of the dynamics of strong interactions
- This resulted in remarkable interest over the last decades on both their formal and phenomenological aspects
- At modern colliders heavy-flavor production enters the two-scale regime: $s\gg m_Q^2\gg \Lambda_{QCD}^2$
- Besides usual renormalization group logarithms, the perturbative series is affected by large energy-type logarithms

<ロト < 団ト < 巨ト < 巨ト 三 のへで 3/23

BFKL resummation

What is the BFKL resummation?

- The Balitsky-Fadin-Kuraev-Lipatov (BFKL) approach is the general framework for the resummation of energy-type logarithms
 - Leading-Logarithm-Approximation (LLA): $(\alpha_s \ln s)^n$
 - Next-to-Leading-Logarithm-Approximation (NLLA): $\alpha_s (\alpha_s \ln s)^n$

In which contexts can BFKL approach be applied?

• Semi-hard collision processes, featuring the scale hierarchy

 $s \gg Q^2 \gg \Lambda_{\rm QCD}^2$, Q^2 a hard scale, $\alpha_s(Q^2) \ln\left(\frac{s}{Q^2}\right) \sim 1 \implies$ all-order resummation needed

• UGD sector

The evolution of the Unintegrated gluon density,

$$\mathcal{F}(x,\vec{k}) \quad \text{t.c.} \quad f^g(x,Q^2) = \int \frac{d^2\vec{k}}{\pi\vec{k}^2} \mathcal{F}(x,\vec{k})\theta(Q^2 - \vec{k}^2)$$

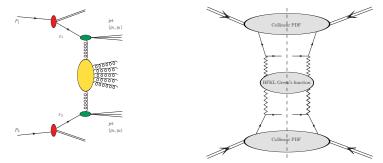

as a function of $\ln(1/x) = \ln(s/Q^2)$, is governed by BFKL:

$$\frac{\partial \mathcal{F}}{\partial \ln(1/x)} = \mathcal{F} \otimes \mathcal{K}$$

Hybrid collinear/high-energy factorization

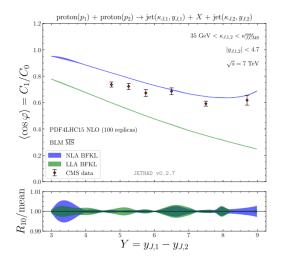

Mueller-Navelet jets

- Inclusive two jet production in proton-proton collision
- Large p_T and large rapidity separation
- Large energy logarithms \rightarrow BFKL resummed partonic cross section
- Moderate values of parton $x \to \text{collinear PDFs}$

• **Hybrid** formalism: can be extended to several type of semi-hard reactions

hybrid collinear/BFKL approach

- high-energy hadroproduction of a J/Ψ meson and a jet, with a remnant X
- both the J/Ψ and the jet emitted with large transverse momenta and well separated in rapidity
- NLA BFKL + NLO jet + LO J/Ψ
 - LO J/Ψ IF calculated in **NRQCD** (Color-singlet and Color-octect)
 - LO J/Ψ IF calculated in color evaporation model (CEM)
- Realistic CMS and CASTOR rapidity ranges, fixed p_T final states

[R. Boussarie, B. Ducloué, L. Szymanowski, S. Wallon (2018)]

◆□ ▶ ◆□ ▶ ◆ ■ ▶ ▲ ■ → ○ へ ○ 16/23

Conclusions

- Heavy flavored emissions represent a promising channel to investigate the semi-hard regime of QCD, providing with a fair stability of the BFKL series
- Theoretical predictions, including complete (or partial) NLLA effects can be build in the context of the hybrid collinear/high-energy factorization
- Early efforts were made to shift the focus to the production of bound states

Outlook

- More phenomenological analysis on bound states (D* meson, $J/\Psi,...$)
- Inclusion of subleading corrections from the heavy-quark pair impact factors, needed to produce full-NLLA predictions.
- Single forward heavy-flavored jet production, via the introduction of the small-x transverse-momentum-dependent gluon distribution (UGD)

Thank you for the attention

Towards bound states: Flavor number schemes

- The mass of light quarks (q = u, d, s) is always set to zero. They are always present in the initial state
- The presence in the initial state and the way one must treat the mass of an heavy-quark (Q = c, b, t) depends on kinematical conditions

• Zero-mass variable flavor number scheme

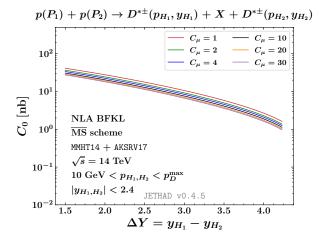

- $-m_Q = 0$
- Heavy quark is present in the initial state above a fixed threshold.
- Powers of $m_Q^2/p_{T,HQ}^2$ missed by the scheme
- It is appropriate in region of high $p_{T,HQ}^2 \gg m_Q^2$

• Fixed flavor number scheme

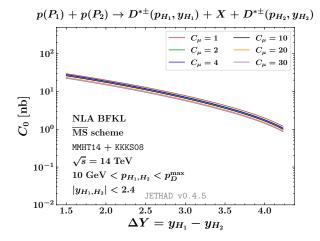

- $-m_Q \neq 0$
- Heavy quark is present only in the final state
- Logarithms of $p_{T,HQ}^2/m_Q^2$ missed by the scheme
- It is appropriate in regions of moderate $p_{T,HO}^2$

• General-mass variable flavor number schemes

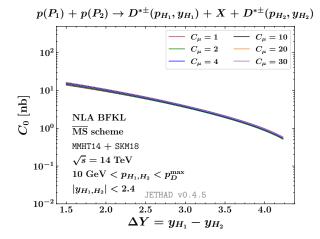

- It is a matching between the previous schemes
- There is some arbitrariness in the combination
