

The IDEA Dual-Readout Calorimeter Simulation

Lorenzo Pezzotti - CERN
on behalf of The IDEA Collaboration

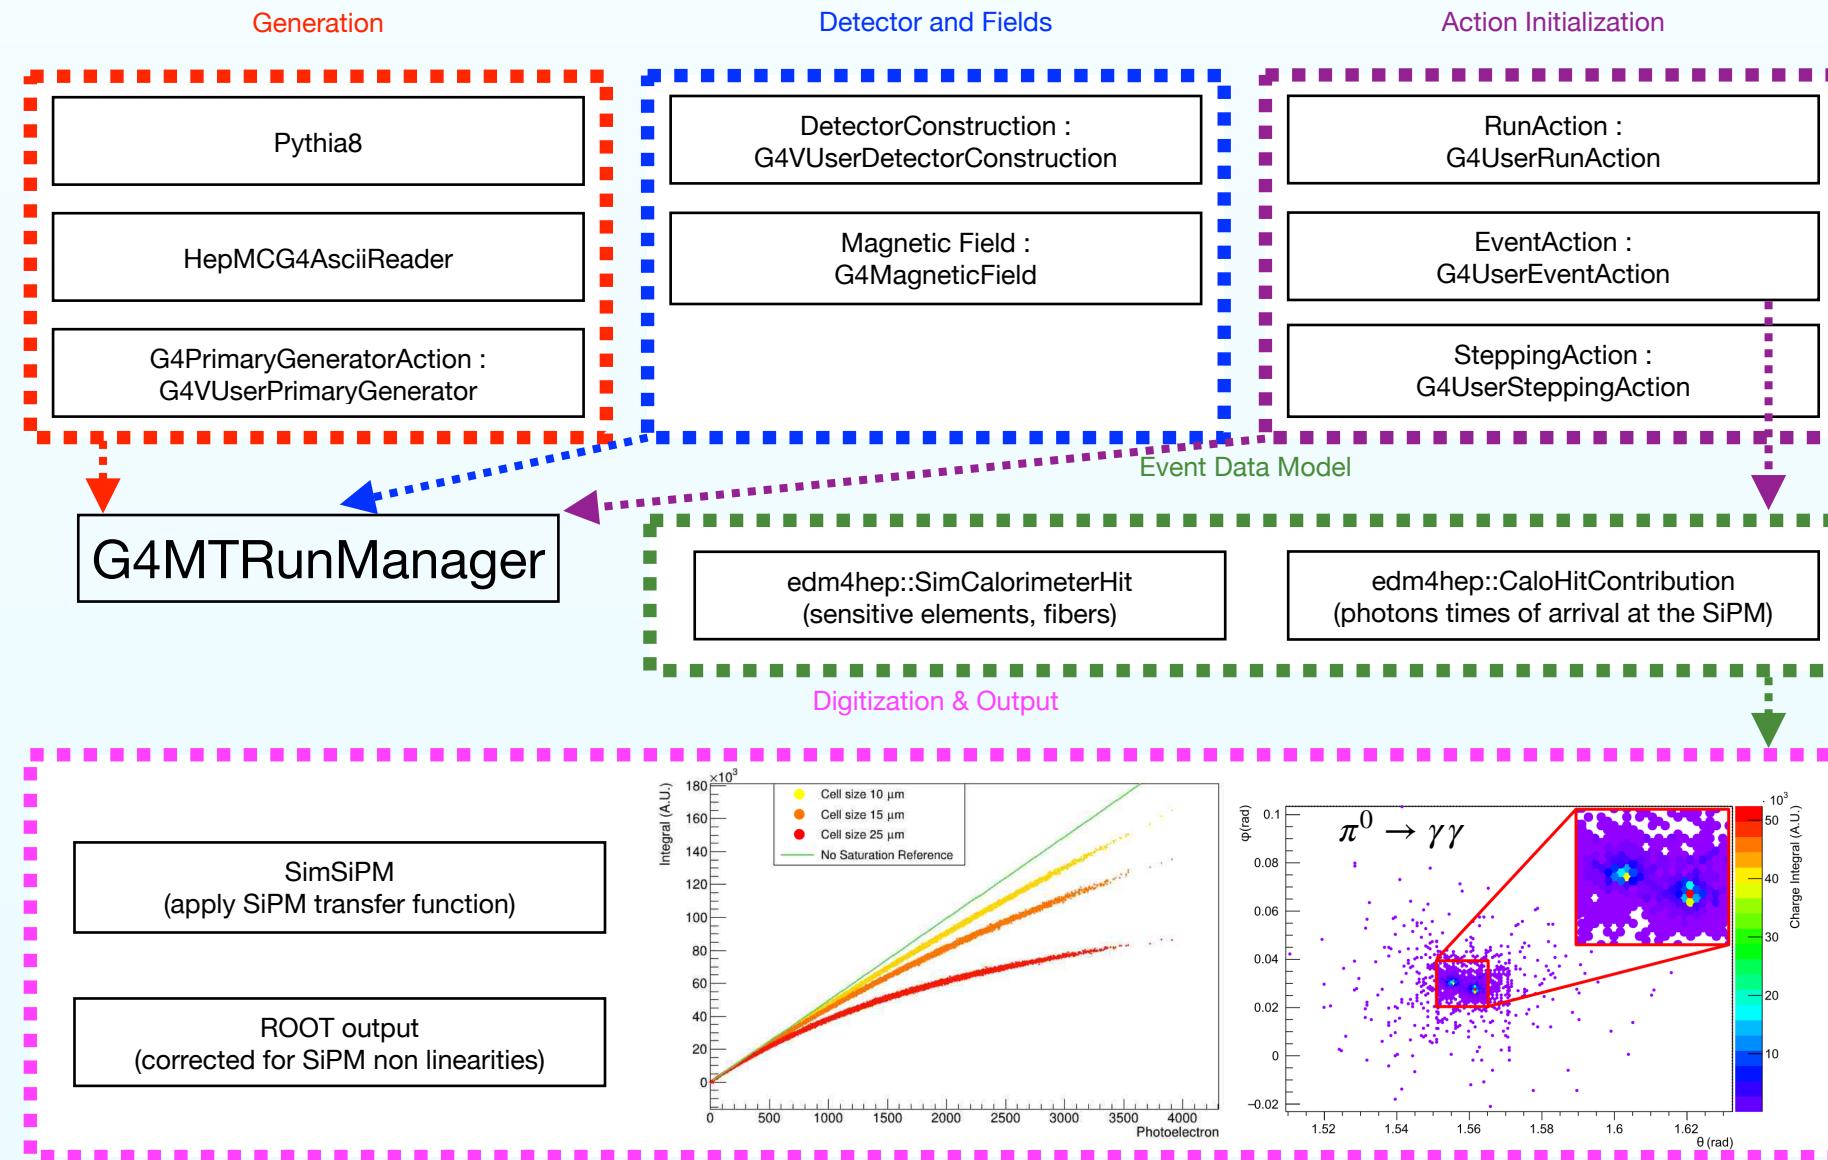

① Introduction

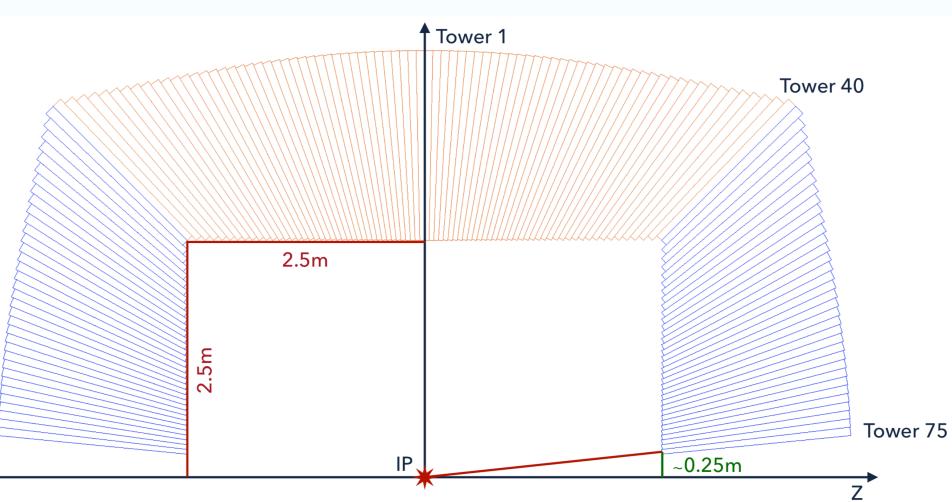

The IDEA Detector concept is designed for post-LHC high-luminosity electroweak factories. To match the precision physics program requirements envisaged, it adopts an ultra-light drift chamber, followed by an ultra-thin solenoid and a highly-granular tower-based optical-fiber dual-readout calorimeter.

The Cherenkov and scintillation lights produced in the showers development are used to achieve the benefits of compensating calorimetry. Eventually, the unsegmented calorimeter can be combined with a dual-readout crystal electromagnetic section for superior performance in photon detection.

② Code

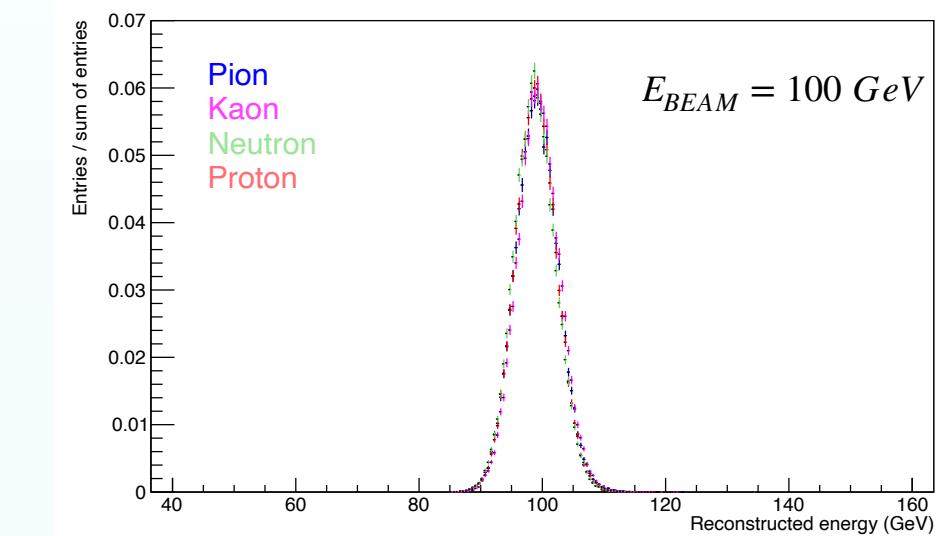

Geant4 fiber calorimeter detector description

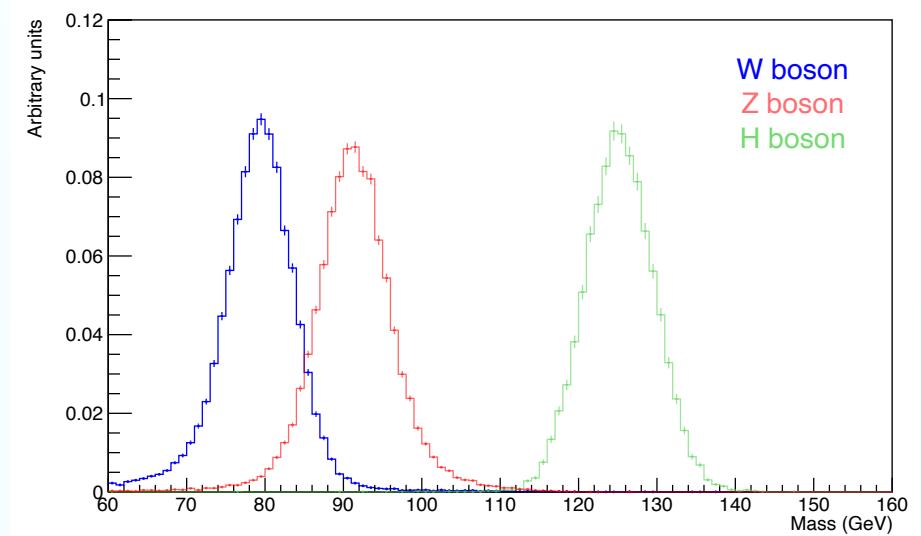

③ Selected Results

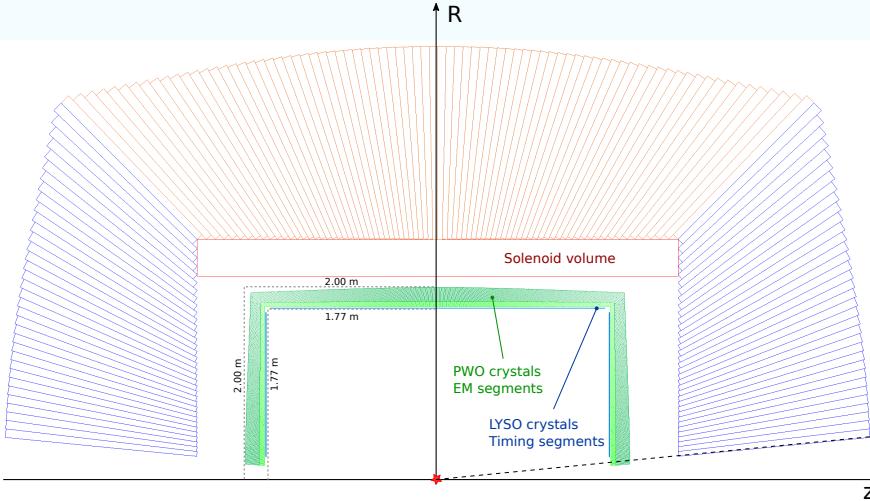

Response to hadrons automatically equalized with the dual-readout correction

W/Z bosons separation through invariant mass measurements in 2-jet final states

Geant4 hybrid calorimeter DR fibers + DR crystals

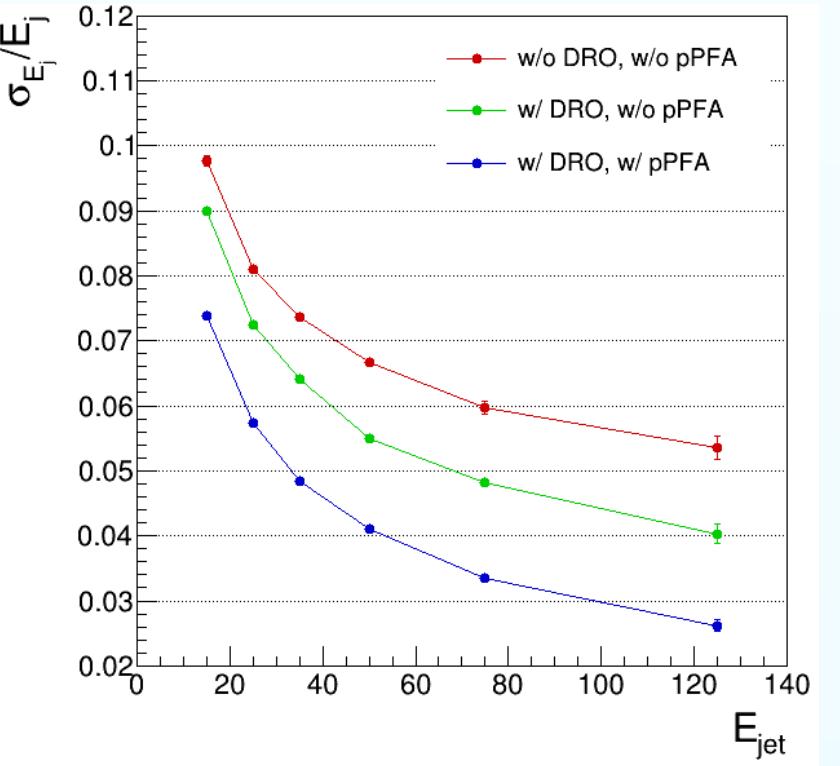

Combine DR crystals and fibers for energy measurements

$$E_{HCAL} = \frac{S_{HCAL} - \chi_{HCAL} C_{HCAL}}{1 - \chi_{HCAL}}$$

$$E_{ECAL} = \frac{S_{ECAL} - \chi_{ECAL} C_{ECAL}}{1 - \chi_{ECAL}}$$

$$E_{tot} = E_{HCAL} + E_{ECAL}, \chi = (1 - h/e_S)/(1 - h/e_C)$$

Apply proto-Particle-Flow approach to match tracks and calo clusters

④ Conclusions and Contacts

The IDEA Calorimeter Group provides a Geant4-based full simulation of a fully-projective DR calorimeter. First results indicate a major improvement with respect to standard calorimeters in suppressing response variations to different particles and in jet-final-state reconstruction.
