Contribution submission to the conference Dortmund 2021

Prospects of fast timing detectors for particle identification on the future Higgs factories — •Bohdan Dudar[1,2], Rémi Ete[1], and Jenny List[1] — [1]DESY, Hamburg, Germany — [2]Hamburg University, Germany

Future e^+e^- colliders are excellent tools to probe fundamental physics beyond Standard Model via Higgs and electroweak precision measurements.

Modern silicon detectors are able to measure time-of-arrival with high precision of O(10 ps). This can be used to measure the time-of-flight (TOF) of the particles and improve their identification.

We develop reconstruction and calibration algorithms based on TOF information to separate $\pi^{\pm}$, $K^{\pm}$, p, $\bar{p}$ particles in future Higgs factory detectors. Furthermore, we study how to implement fast timing silicon layers in the tracking and/or calorimeter systems, in order to derive requirements on the time resolution. As an example case, the ILD detector concept is studied.

The $K^{\pm}$ mass measurement is a simple benchmark to test the performance of TOF algorithm. A precision at the level of 10 keV can be expected, which would significantly improve the knowledge of the $K^{\pm}$ mass.
