

# HICS signal summary

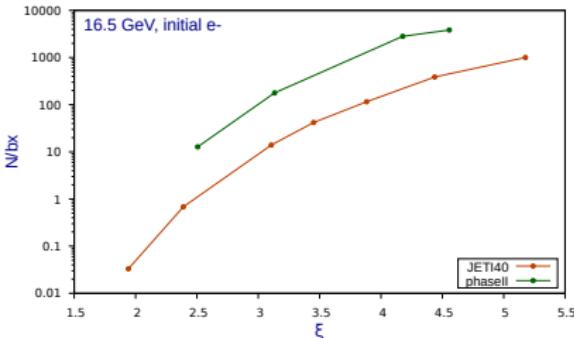

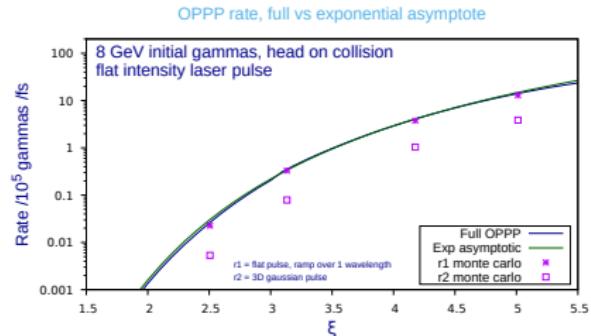

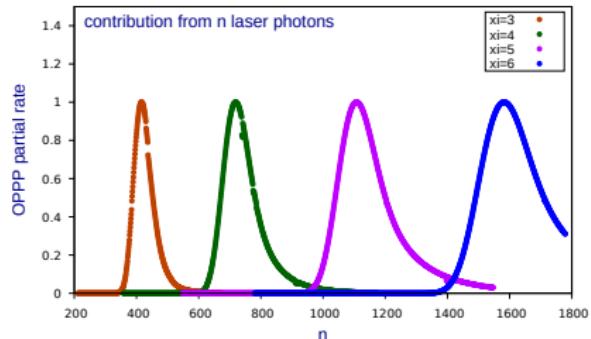

- Updates over the last weeks:
- HICS summation increased to  $n$  (laser photons) =  $10 * (1 + \xi^3)$ . So, HICS spectrum obtained a high energy tail.
- Normalisation fixed. So, overall spectrum decreased
- Validation of total HICS rate against monte carlo.
- Regeneration of e\_laser data in progress.

up to date data in [/afs/desy.de/user/h/hartin/public/IPstrong\\_V1.1.00/JETI40](https://afs/desy.de/user/h/hartin/public/IPstrong_V1.1.00/JETI40)

"old" data in [/afs/desy.de/user/h/hartin/public/IPstrong\\_V1.1.00/superseded\\_data](https://afs/desy.de/user/h/hartin/public/IPstrong_V1.1.00/superseded_data)

# OPPP signal summary

- Updates over the last weeks:
- OPPP summation (over  $n$  laser photons) needs to be increased for  $\xi > 5.5$ .
- Validation of OPPP total rate, Exponential asymptote and monte carlo sound to  $\xi = 5.5$
- Generally trident in phasell better because wider pulse for same  $\xi$ : more electrons see high  $\xi$  central part of pulse
