

Parallel computing: application.

Artem Bohdan

Hierarchy of computational units

1. Processor core
2. Node (~20-100 cores): MPI and OpenMP (multicore CPU), CUDA (GPU)
3. Server (~10k cores): MPI
4. Cluster (up to 1M cores): MPI

CUDA - Compute Unified Device Architecture

CPU - Central processing unit

MPI - Message Passing Interface

OpenMP - Open Multi-Processing

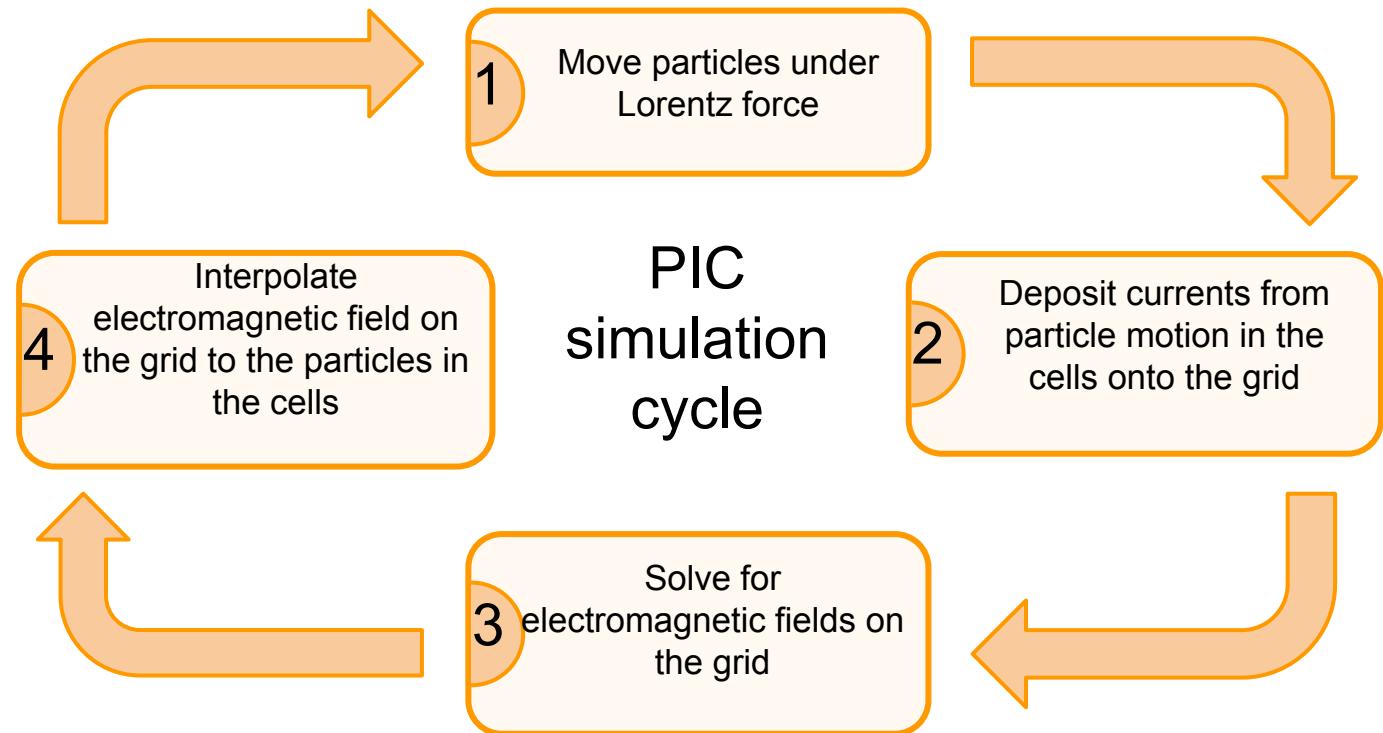

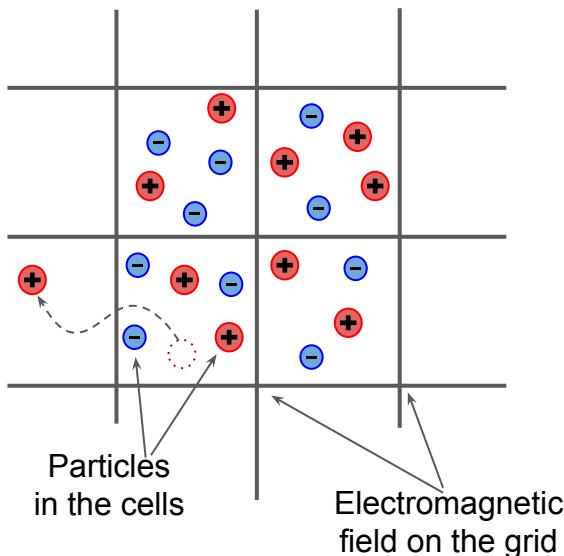

GPU - Graphics processing unit

Types of parallel computing

1. Without communications (Monte Carlo: considers independent events)
2. With communication (plasma simulations: splits simulations box in to smaller regions)
3. Mixture

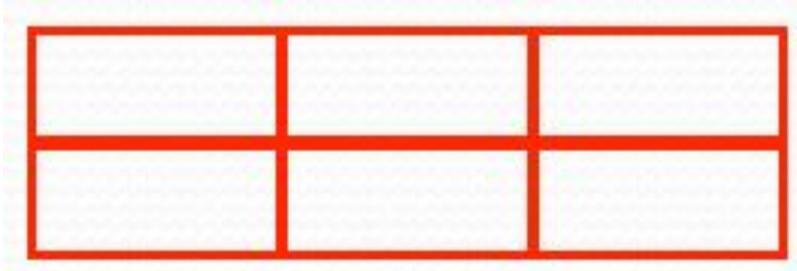

Particle-in-cell (PIC) codes

Spatial domain

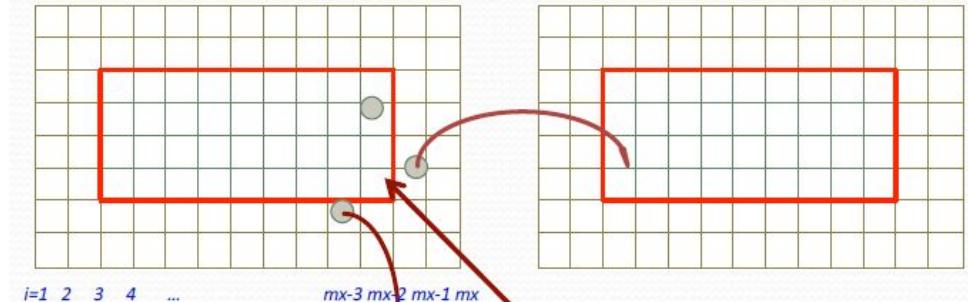

Parallelization of PIC codes

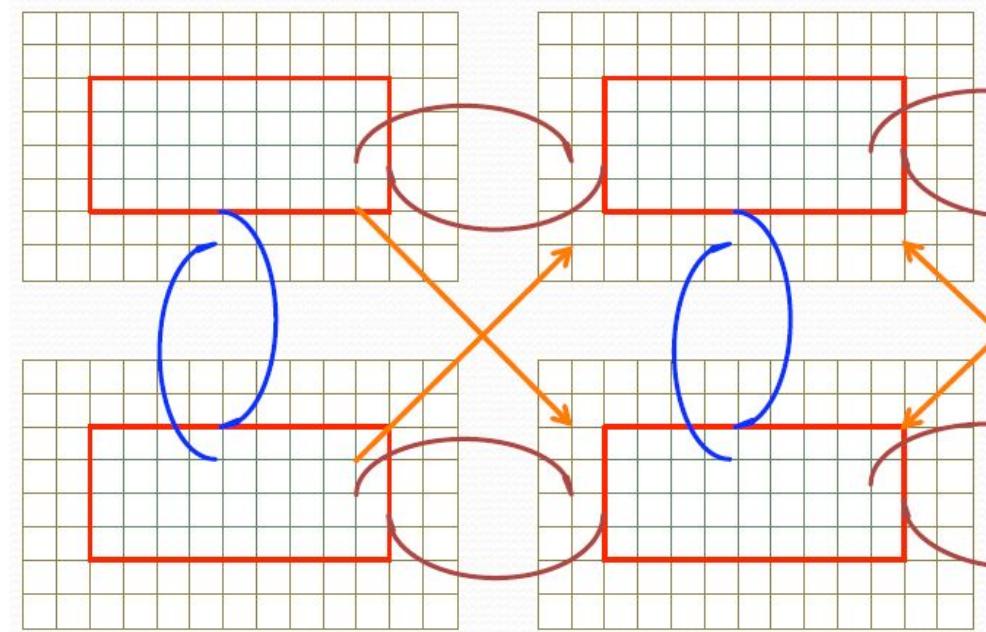

Simulation box

Particles

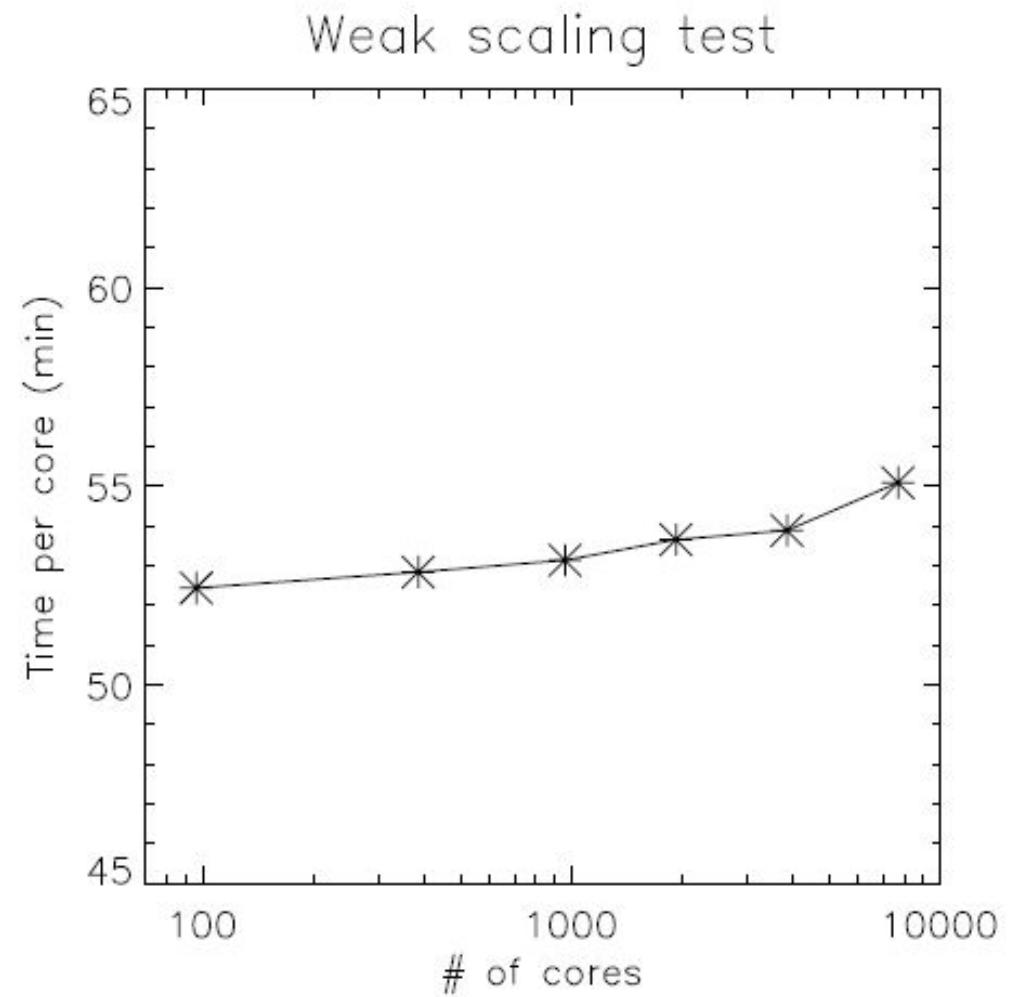

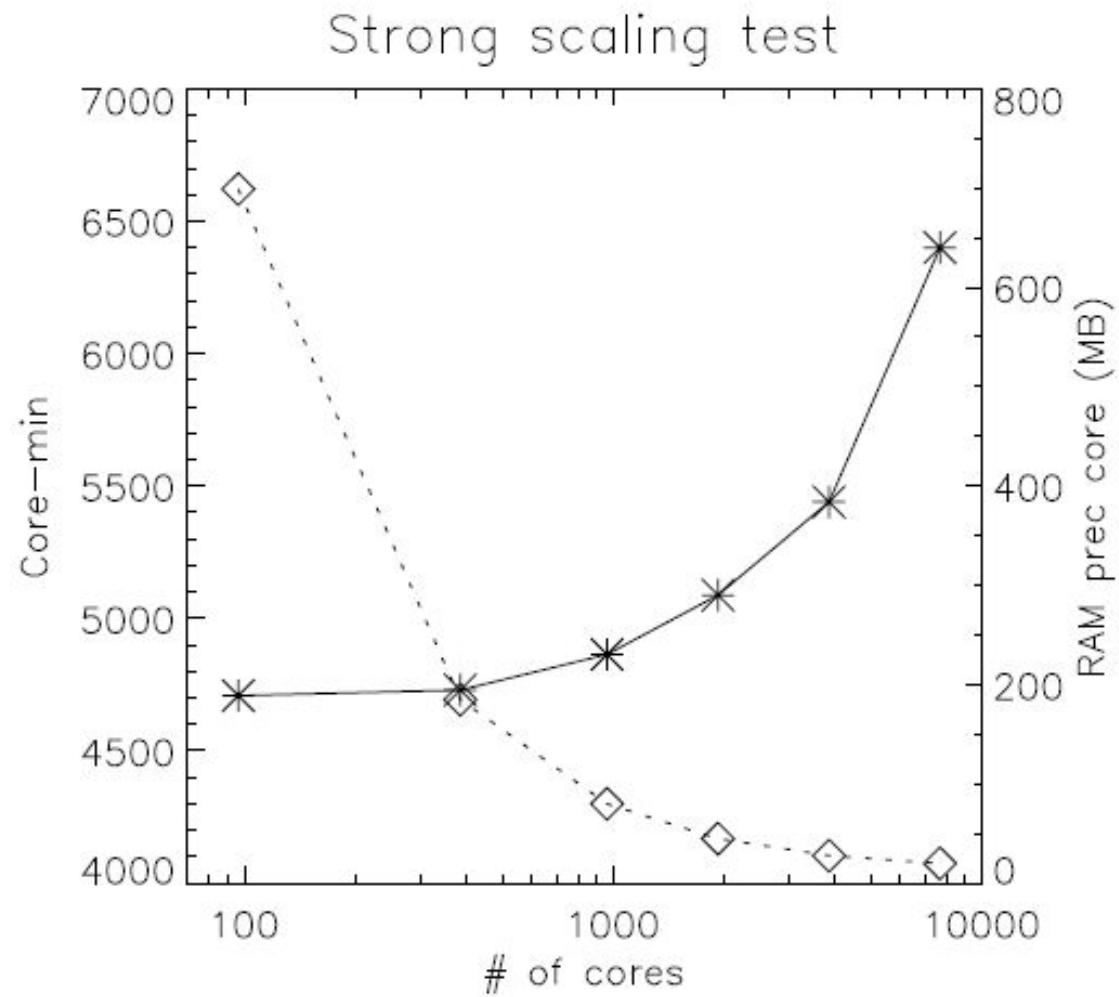

Fields

Types of parallelizations:

1. MPI
2. MPI-CUDA
3. MPI-OpenMP

PIC code scaling

Computational clusters

HLRN (Germany)

- 8.9 PFlop/s (TOP 47, Nov 2020)
- Intel Xeon Platinum 9242 48C 2.3GHz
- 120,296 cores
- Access via annual applications, deadline
-is the end of October (free of charge for
university users)

Prometheus (Poland)

- 2.4 PFlop/s (TOP 326, Nov 2020)
- Intel Xeon E5-2680v3
- 53,568 cores
- Access via collaboration with polish
scientists

11/2020: #326
