LEAP project

Laser Electron Acceleration with Polarization

Aim: Experimental demonstration of the generation of relativistic polarized electron beams from a laser-plasma accelerator (LPA)

- Generation of a polarized electron beam with LPA
 - ➔ This Talk
- Measuring the polarization of the generated beams
 - ➔ Jennifer Popp: “*Polarimeter Design for a LPA Electron Beam*”

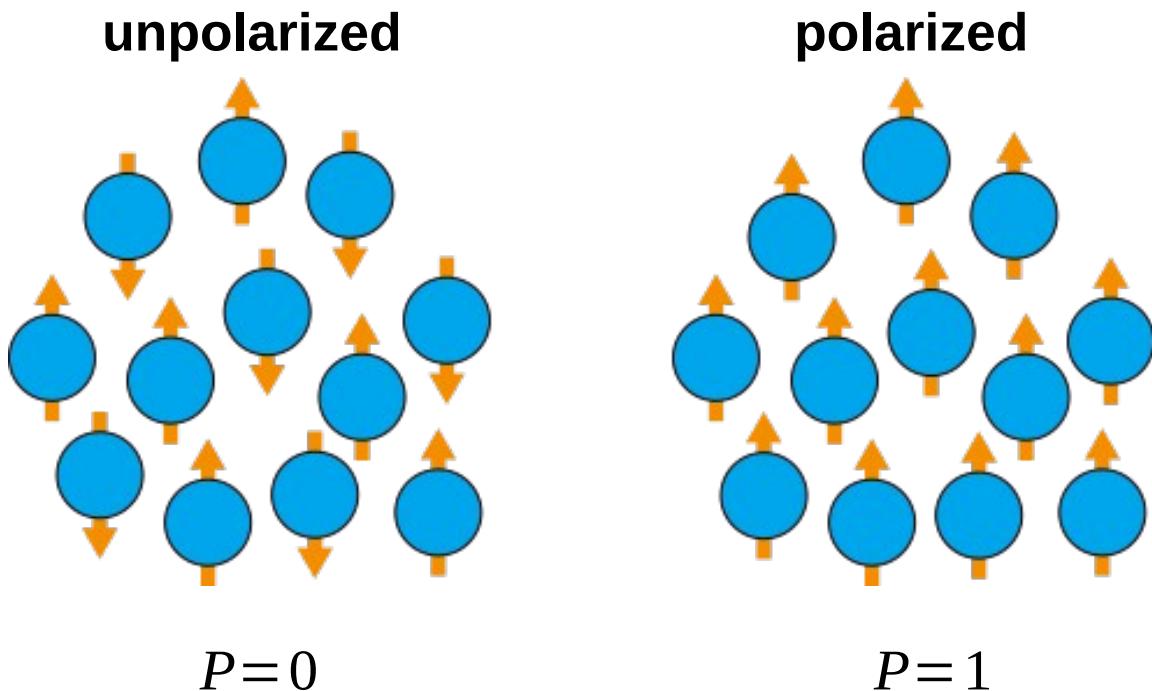

Polarization of an electron beam

What is the polarization and why is it important ?

- The polarization P describes the spin orientation of electrons in an ensemble

$$P = \frac{N_R - N_L}{N_R + N_L}$$

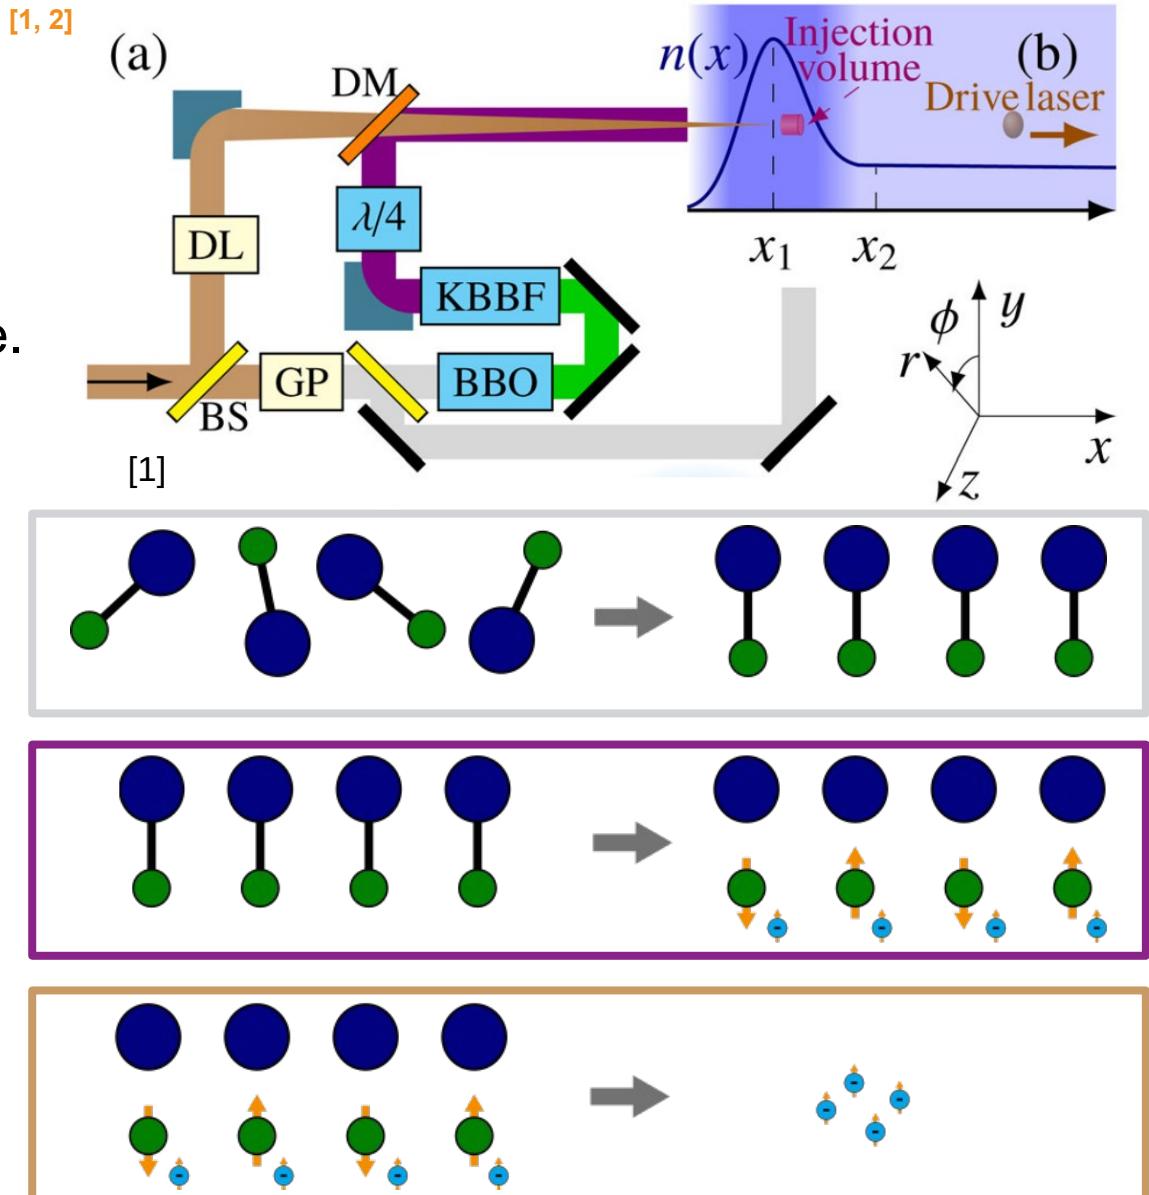

- Polarized beams are indispensable for many experiments in particle, atomic and nuclear physics

How to get polarized electron beams from LPA?

Polarized beams through a pre-polarized gas jet target [1, 2]

- Alignment of HCl molecules with ps IR pulse
- Photodissociation of the molecules with UV pulse.
Spin-orbit coupling results in polarized electrons
- Density downramp injection results
in an accelerated electron beam
- Beam polarization maintained during further
acceleration^[3]

Laboratory

Lab Overview

Laser lab:

- Amplitude laser system
- 25 TW Ti:Sa Laser
- 25 fs, 10 Hz

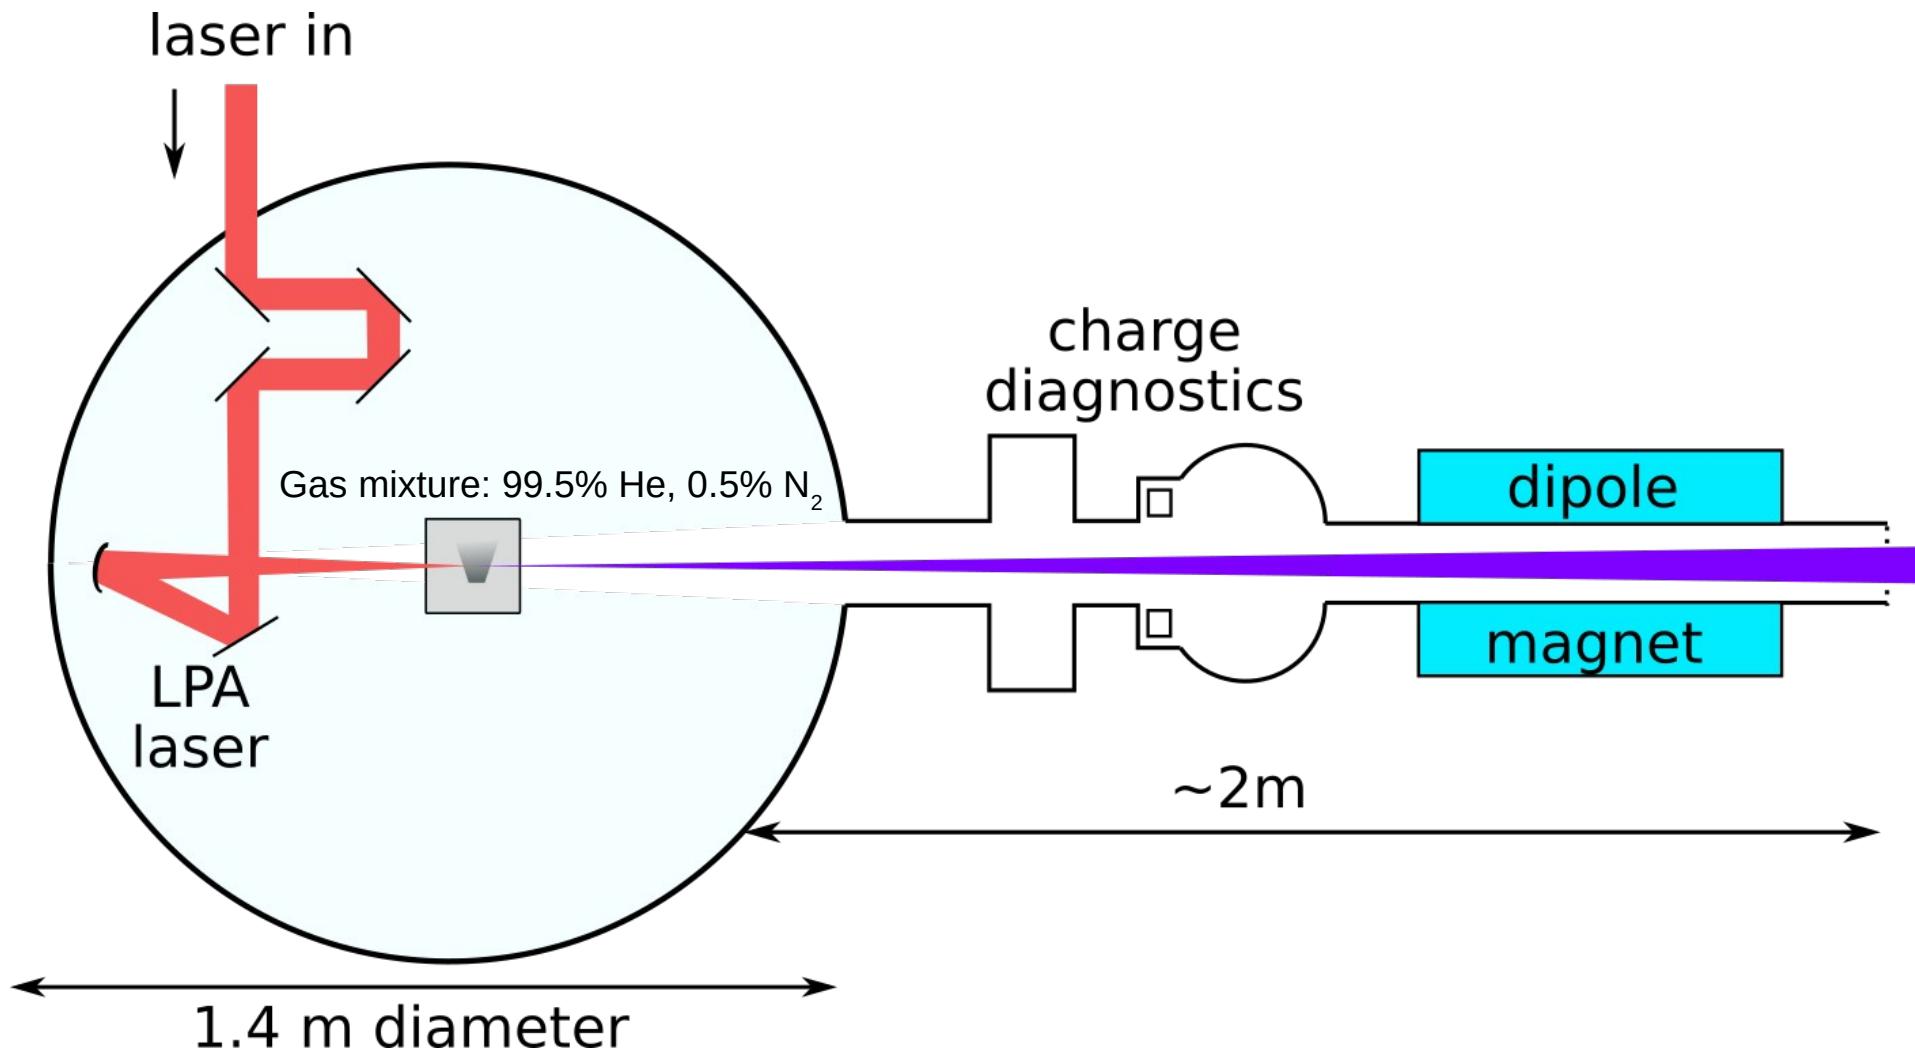

Experimental lab:

- LPA setup to test diagnostics and concepts

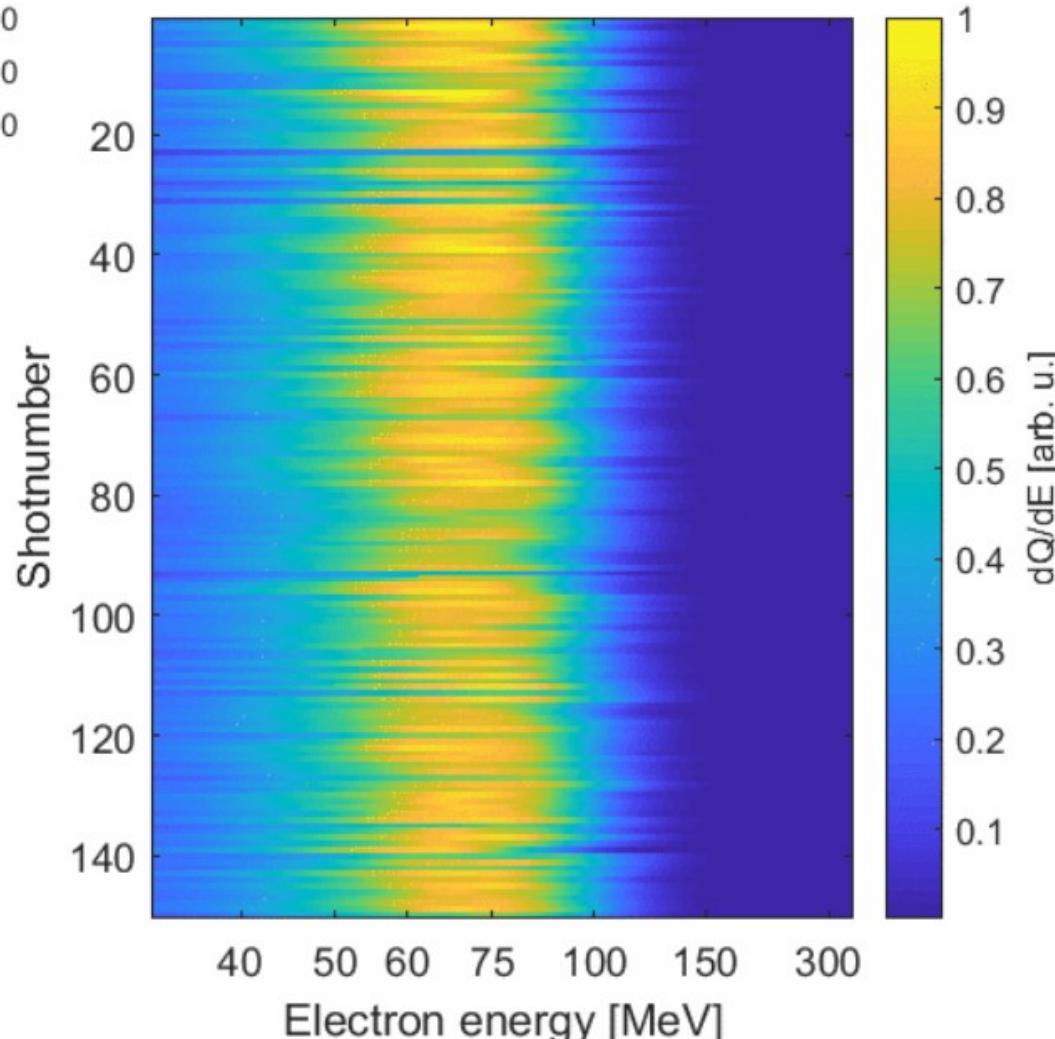

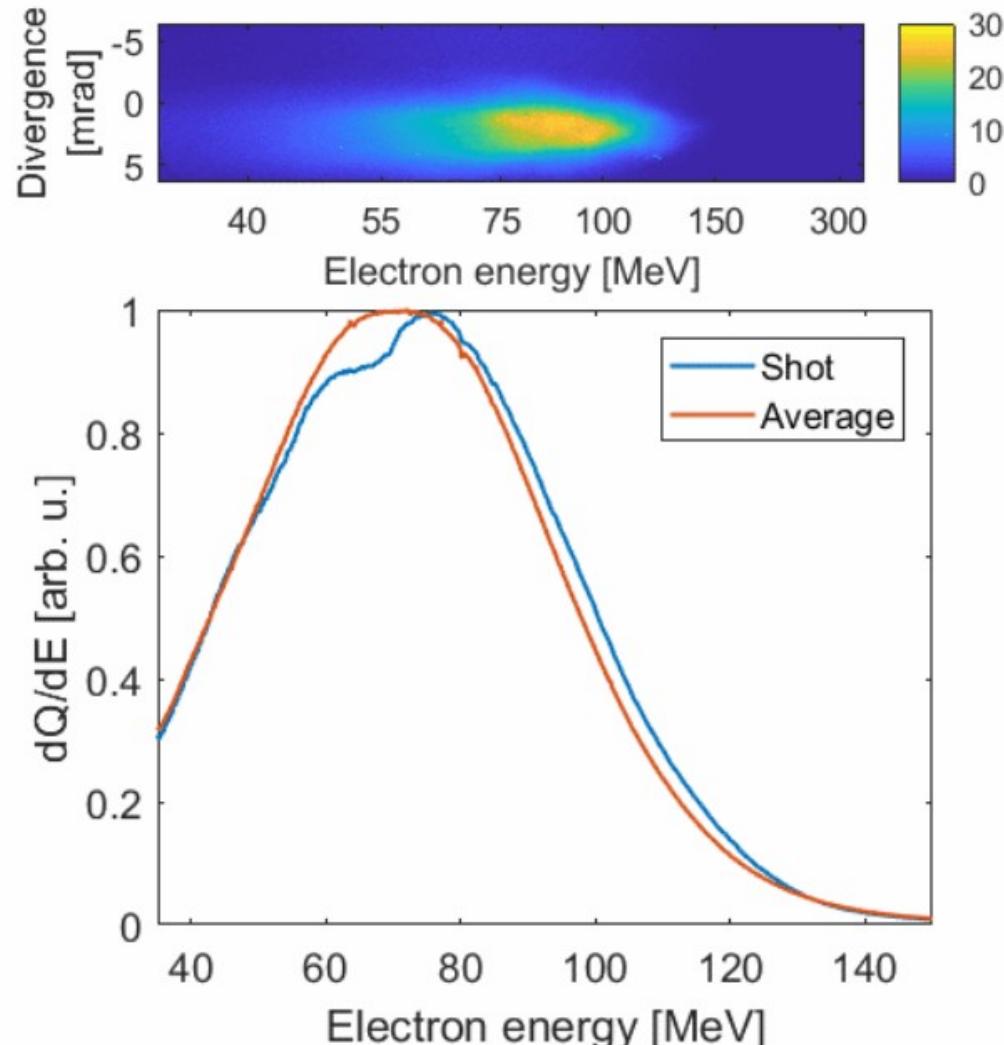

Where we are at the moment

Current setup for LPA using ionization injection

LPA long term measurements

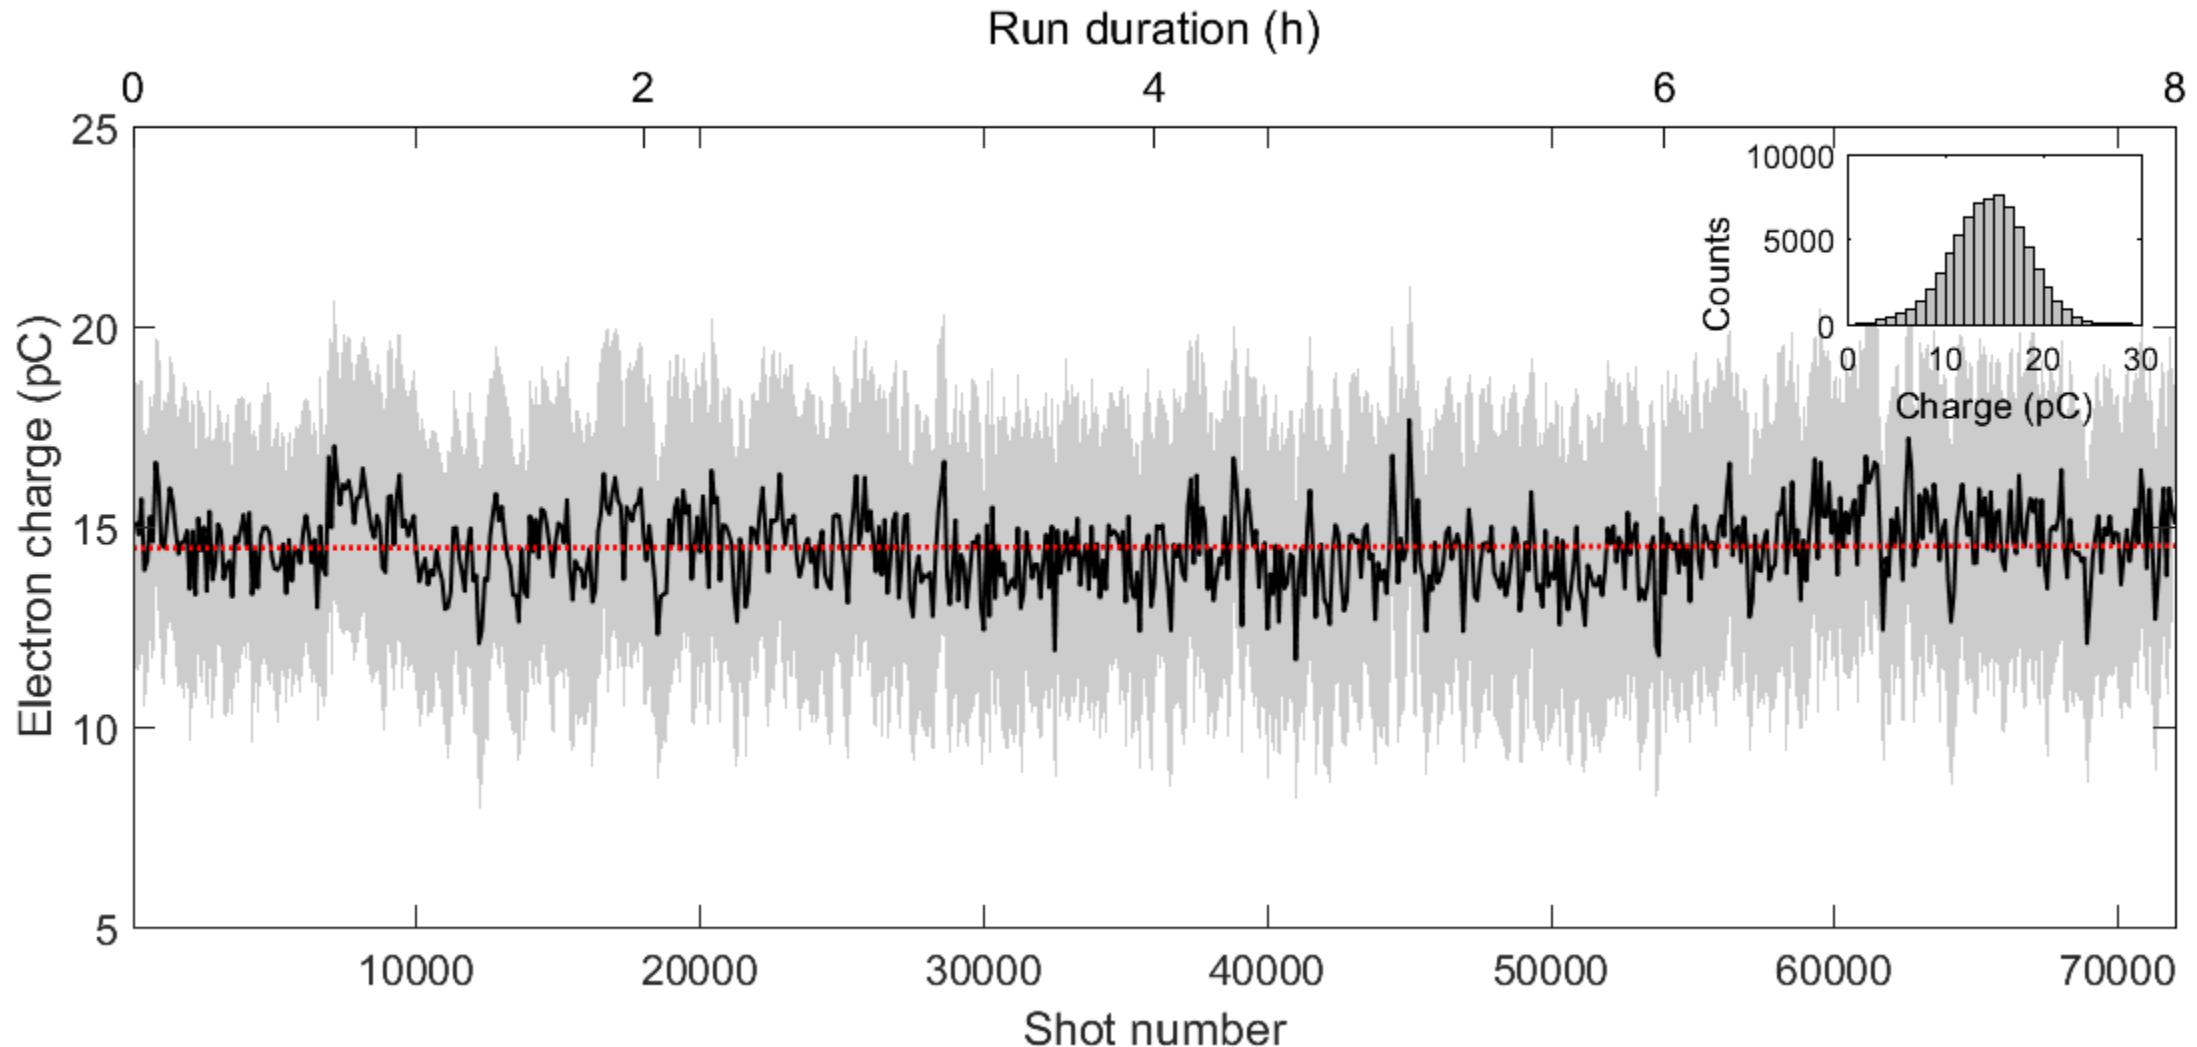

Reproducible energies at a high repetition rate (acceleration at 2.5 Hz using ionization injection)

S. Bohlen, J. Wood, T. Brümmer, F. Grüner, M. Meisel, K. Pöder, T. Staufer and J. Osterhoff, in preparation

LPA long term measurements

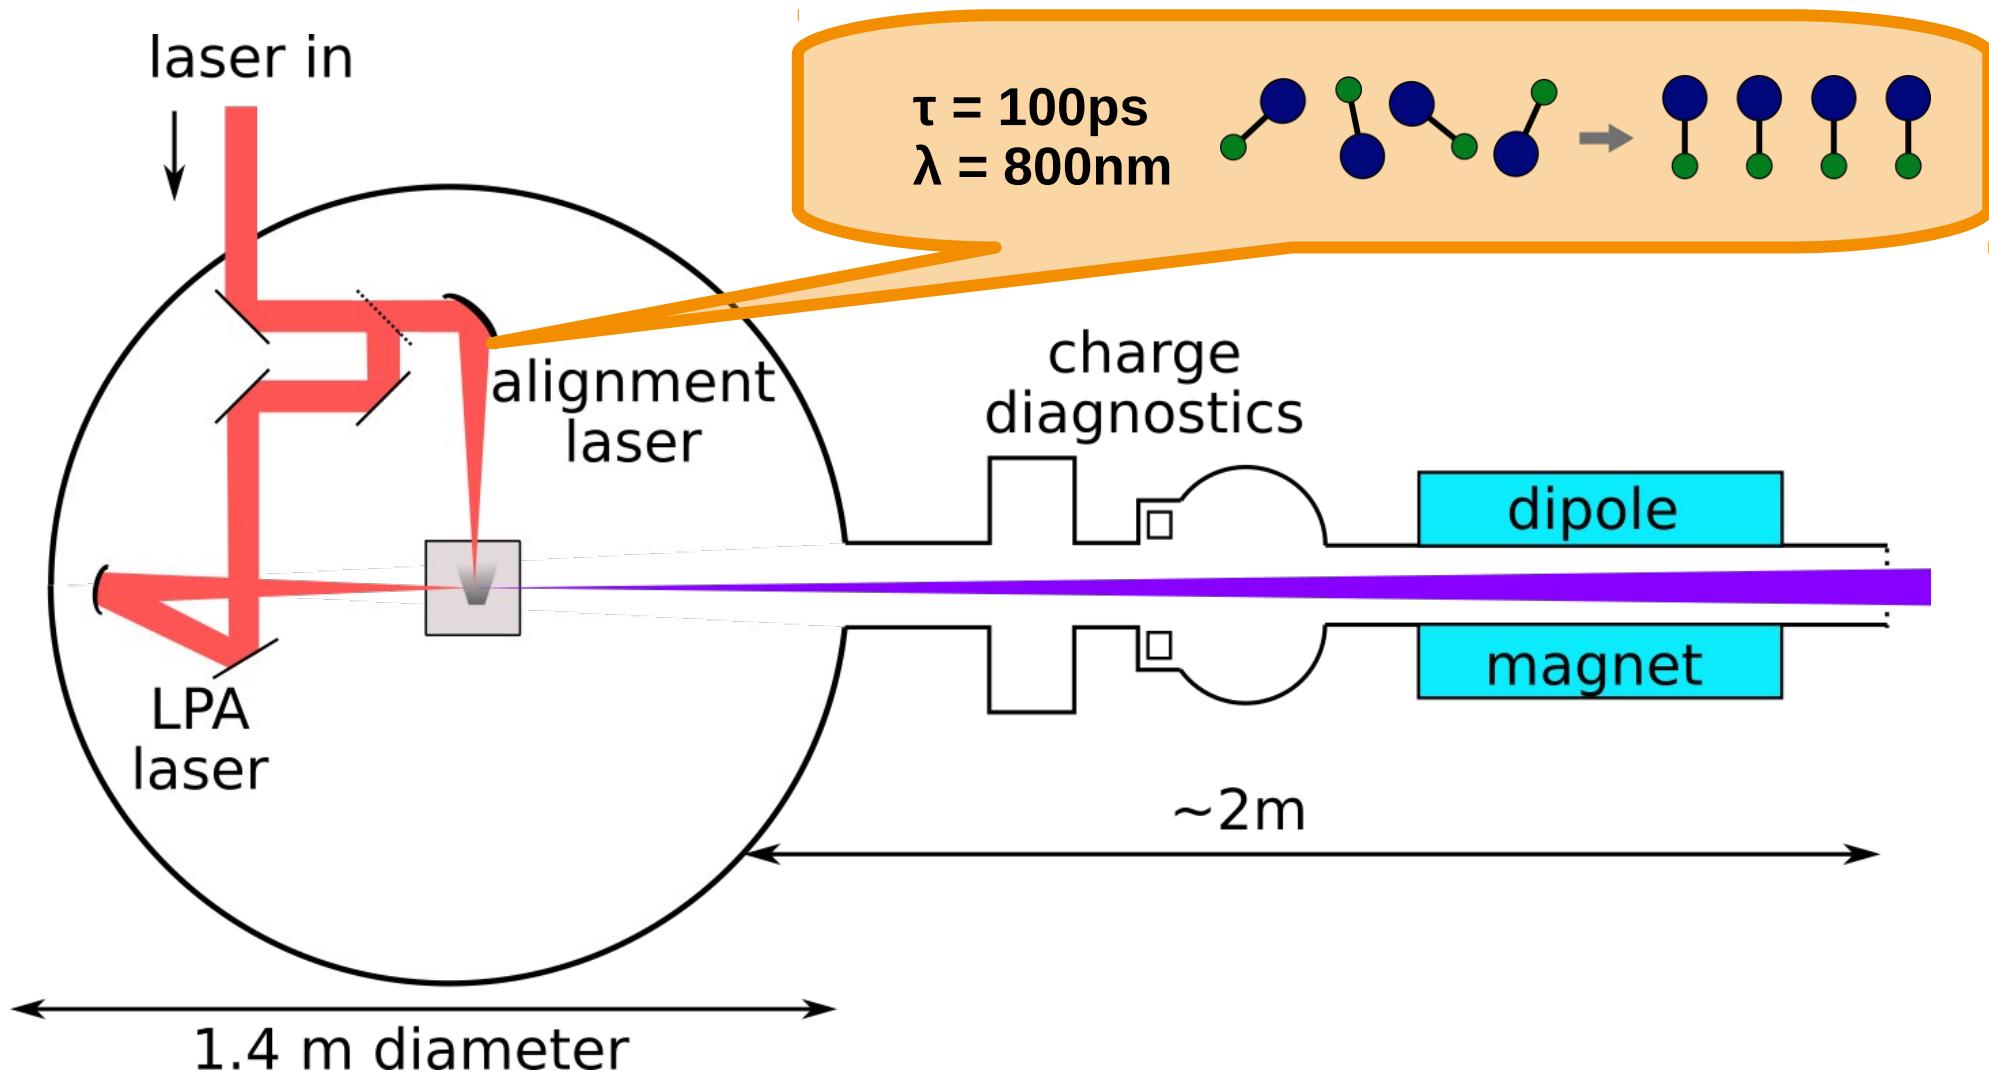

Stable acceleration over several hours in terms of beam charge

S. Bohlen, J. Wood, T. Brümmer, F. Grüner, M. Meisel, K. Pöder, T. Staufer and J. Osterhoff, in preparation

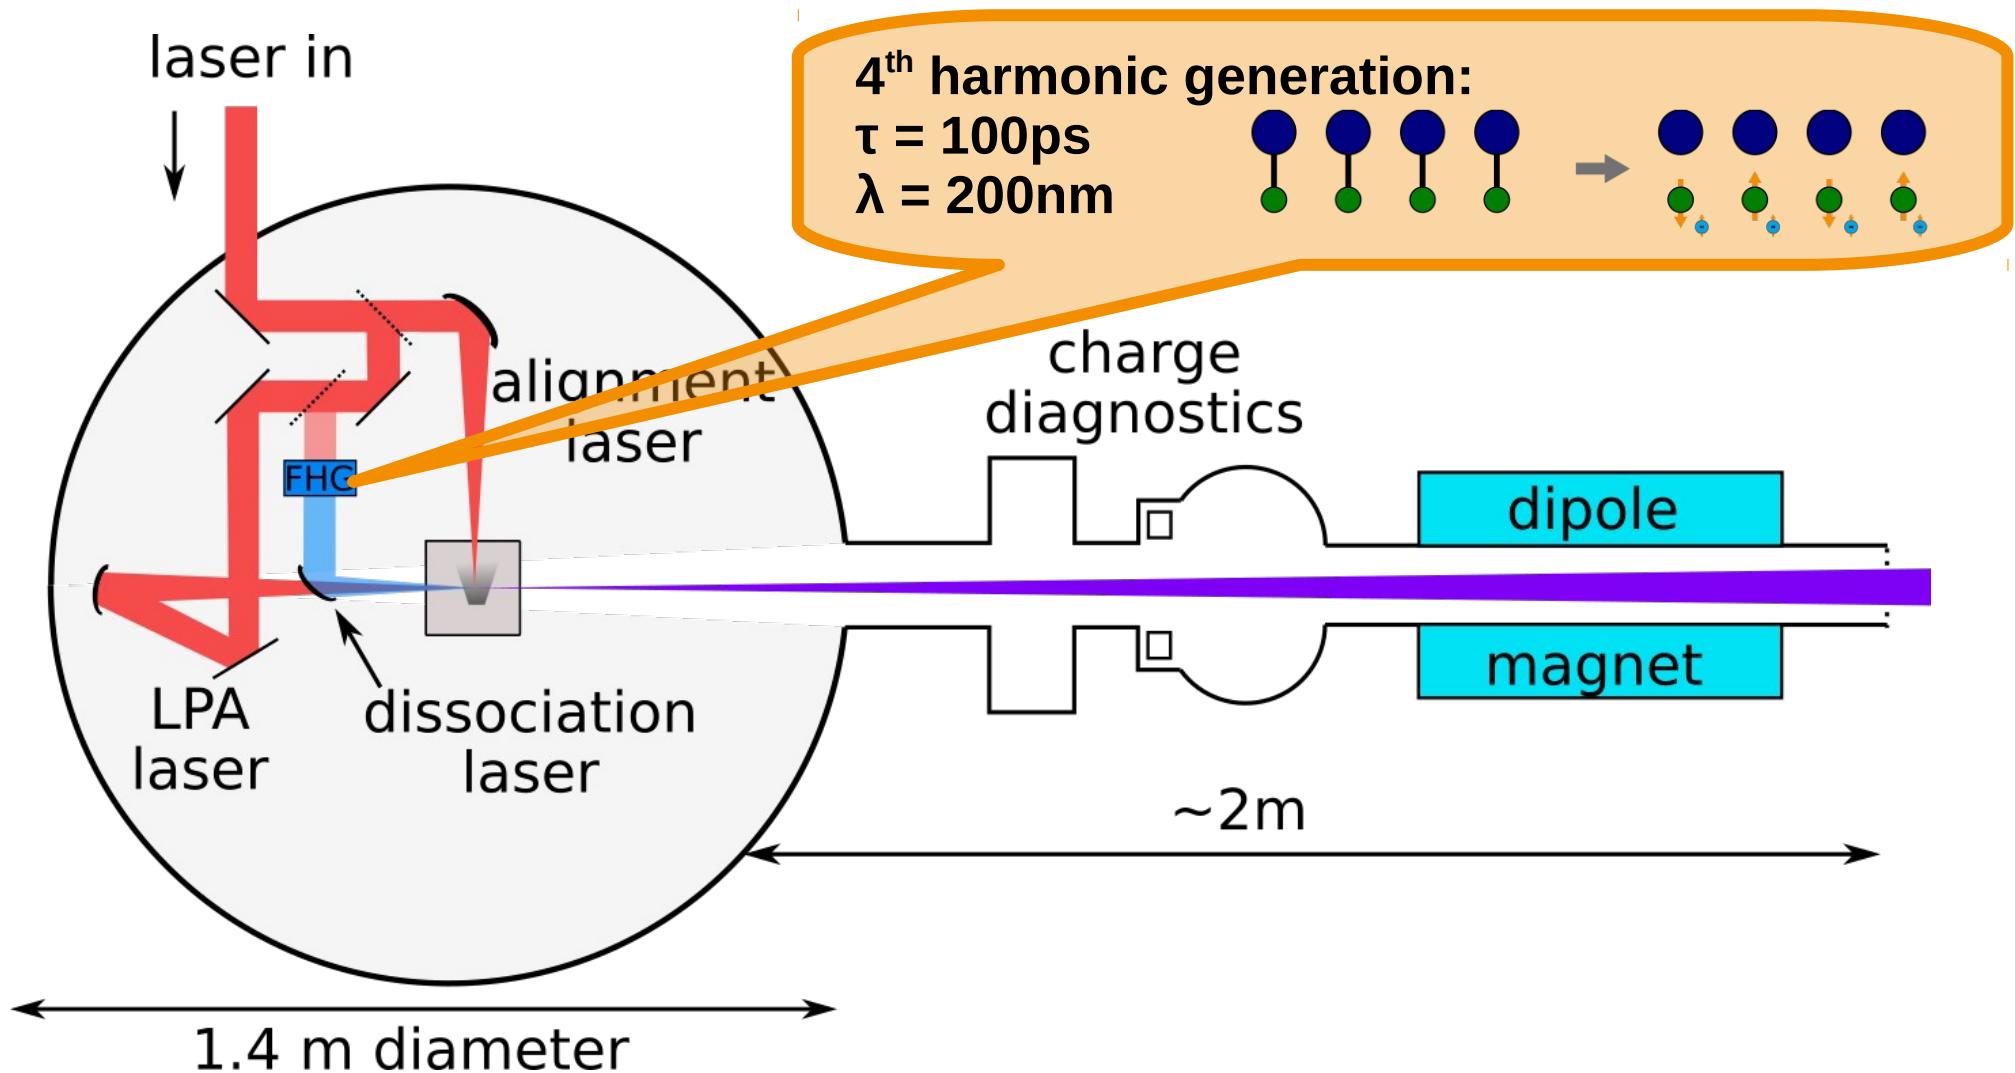

Next updates to the existing LPA setup

Add a laser beam to align the HCl molecules

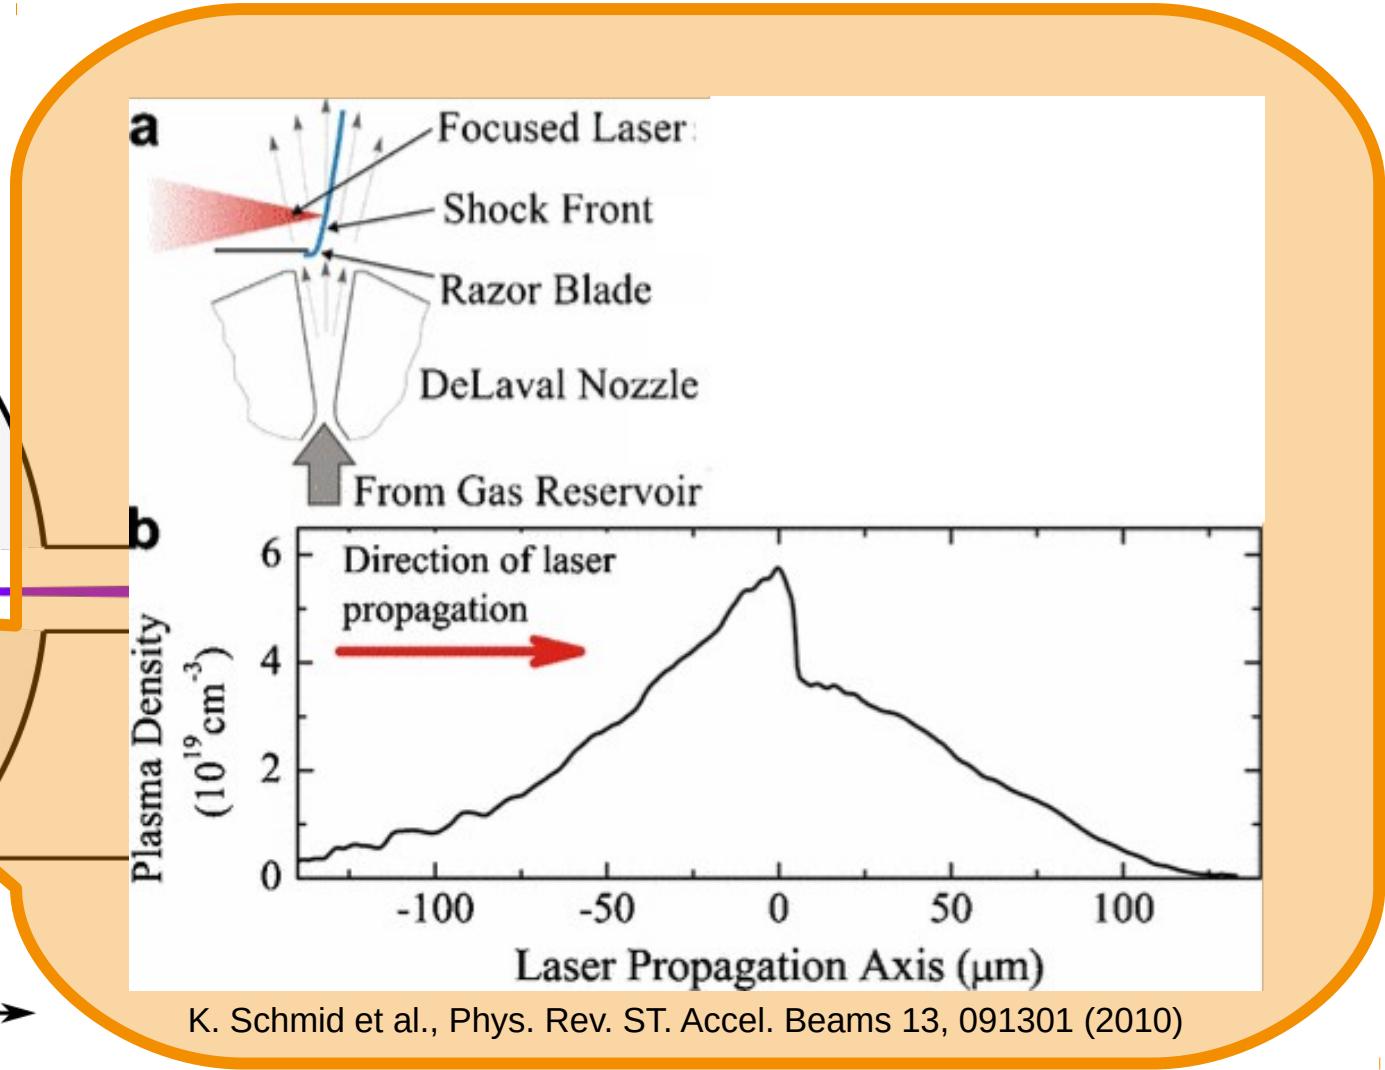

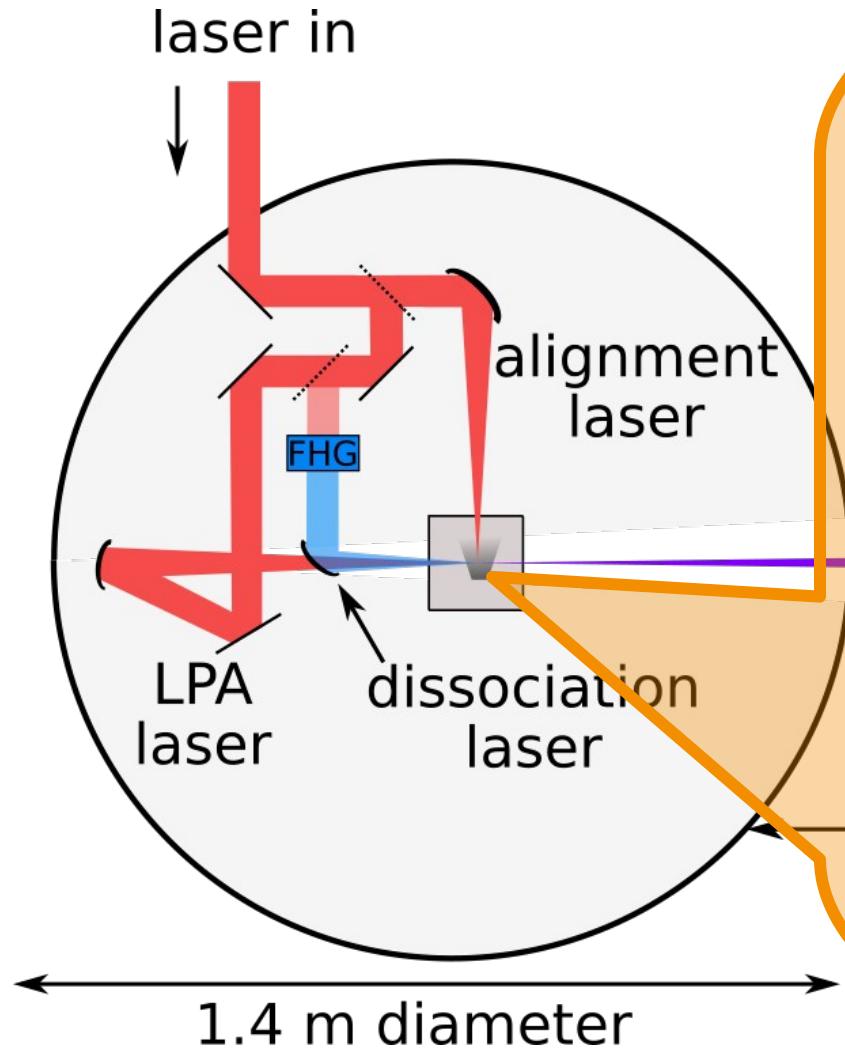

Next updates to the existing LPA setup

Add a UV laser beam to dissociate HCl molecules

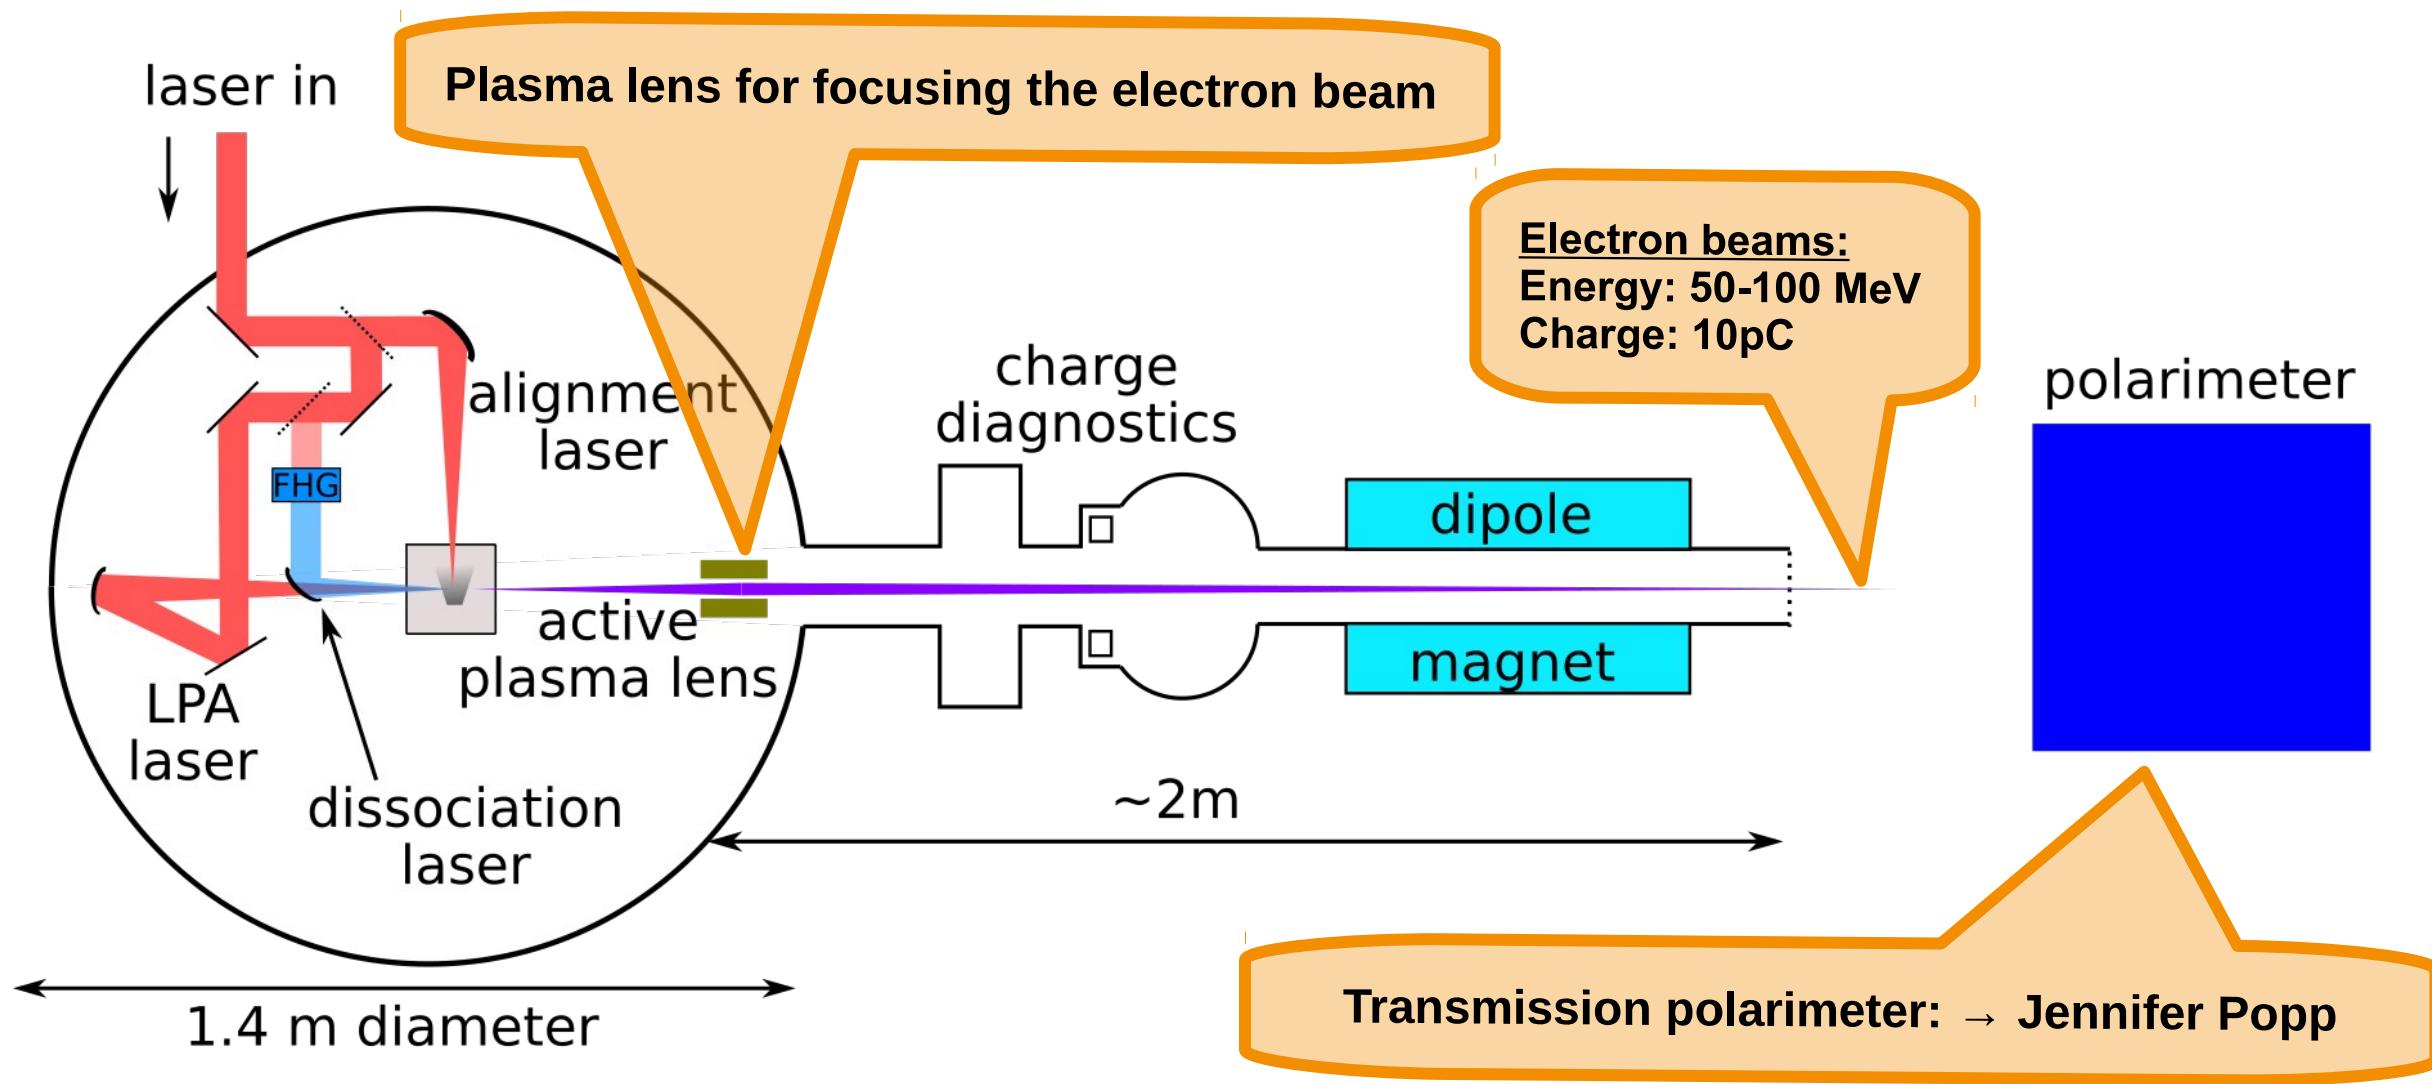

Next updates to the existing LPA setup

Install a knife-edge into the gas jet to create a density downramp

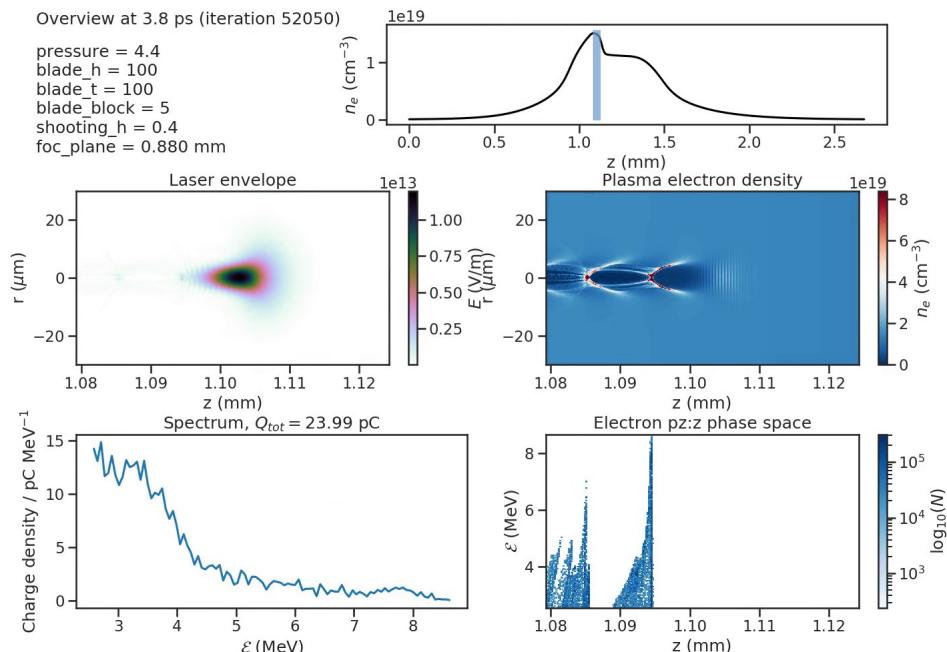

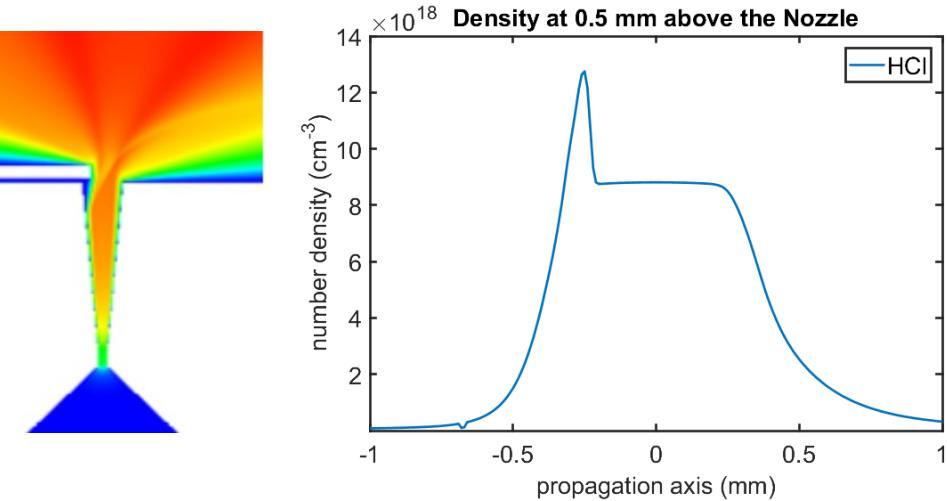

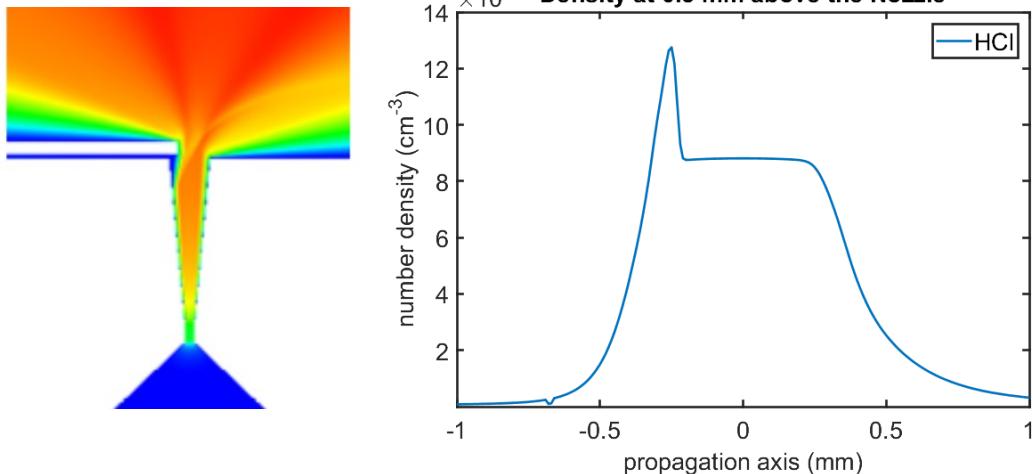

Whole LEAP setup

Schematic sketch of LPA and polarimeter

Work in progress

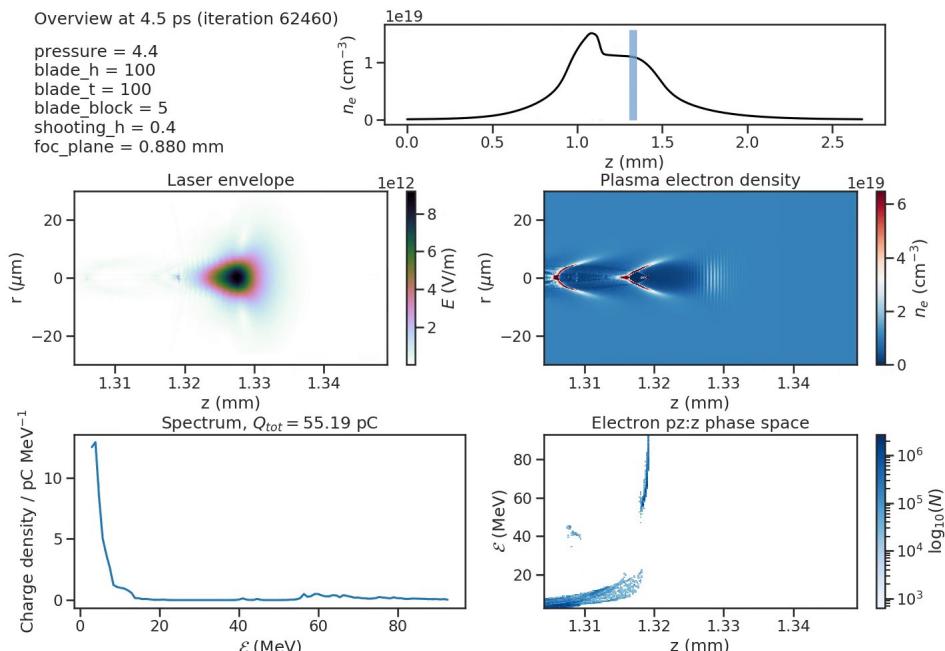

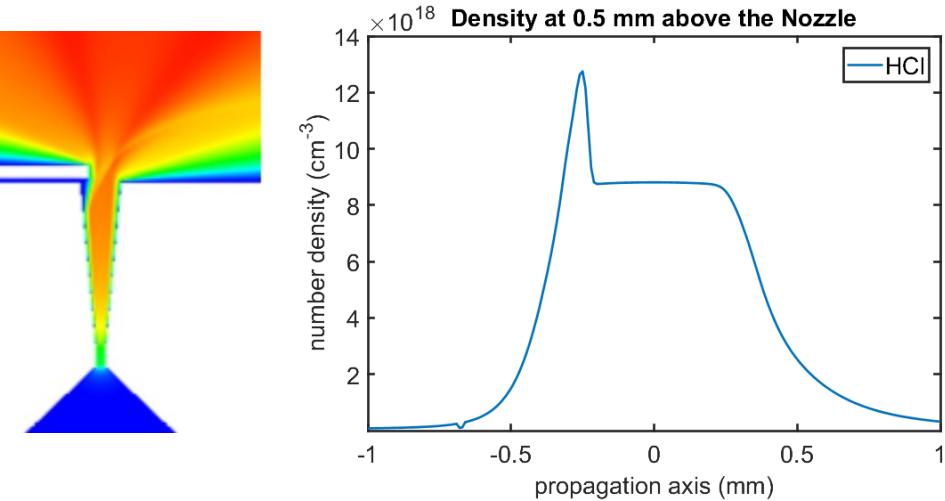

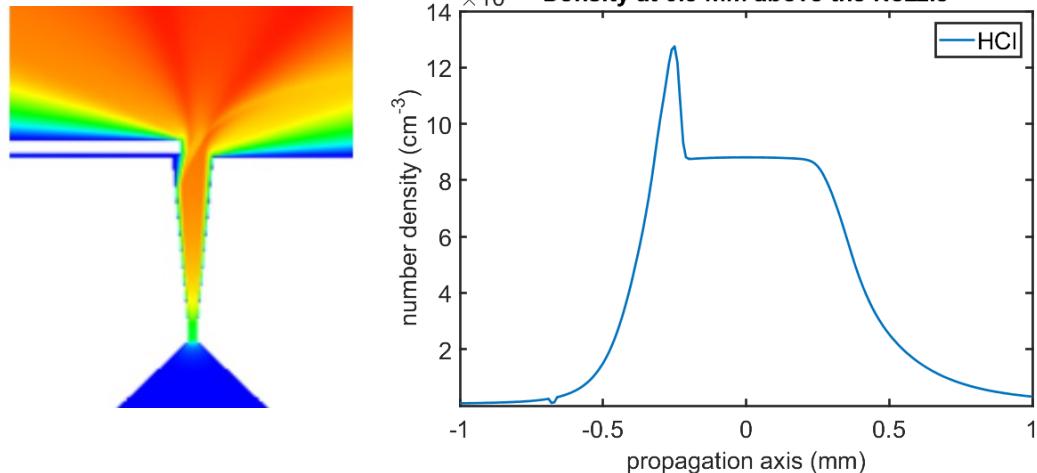

- Flow simulations using ANSYS:
 - Find suitable parameters for density ramp with HCl
- LPA simulations using FBPIC including spin tracking^[1]:
 - Optimise laser parameters (energy, focus position, etc.) and plasma density using ANSYS density profiles for LPA in HCl
- Geant4 simulations:
 - Adjust the polarimeter and detector design to a wide range of parameters
- Still no lab-work at the moment due to COVID-19

Summary

- LEAP: demonstrate the production of a polarized electron beam from LPA
- Existing setup for unpolarized beams:
 - 10Hz gas jet laser electron source
 - Demonstration of long term stability
- Change of the setup required:
 - Modify the target for density downramp injection
 - Additional laser beams to align and dissociate HCl molecules
- PIC and Geant4 simulations ongoing
