

Welcome to DESY!

What is DESY and what kind of research is done here?

Introductory school
„Terascale Physics“
DESY, 23/02/2011

Elina Fuchs

DESY- Press and Public Relations (PR)
Master student in theory group

What is DESY?

➤ **Deutsches Elektronen-Synchrotron**
(German electron synchrotron) DESY

➤ A national research centre of the

➤ Established: 1959 in Hamburg,
1992 in Zeuthen

➤ Annual budget: 192 million euros

- 90% Federal Ministry of Education and Research
- 10% city of Hamburg and federal state of Brandenburg

Helmholtz Alliance of German research centres.

➤ Germany's largest scientific organisation

- 16 research centres
- 30 000 employees
- 3 billion euros annual budget

➤ *Fundamental research* to solve major challenges facing society, science and industry

➤ long-term research projects

Who works at DESY?

- Approximately 2000 employees
 - Among them 650 scientists
- Training programs
 - More than 100 young people trained in commercial and technical jobs
- Young scientists
 - Around 700 graduate students, PhD students and postdocs
- Guest researchers
 - 3400 from 280 universities/ institutes in 40 countries annually

➤ Opportunities for students:

- Summer student program (!!)
- Master/ diploma thesis
- PhD

What kind of research is done at DESY?

➤ Basic research

- 1st : fundamental questions in science
- 2nd : applications later

➤ Research with photons

- molecular and atomic structures with a special light from particle accelerators

➤ Accelerators

- Development, construction and operation of particle accelerators
- used for particle physics and research with photons

➤ Particle physics

- fundamental particles and forces that make up our universe

What is a particle accelerator/collider?

> Charged particles (electrons, protons, ...)

- accelerated by electric fields
- deflected by magnetic fields

> What limits the achievable energy?

- maximum magnetic field strength
- Energy loss due to synchrotron radiation in the curves

> Solutions: Heavier particles

- Storage rings with a larger circumference
- Accelerators without curves → linear colliders

Which accelerators are there at DESY?

The history of accelerators at DESY.

- > 1964: **D**eutsches **E**lektronen-**S**ynchrotron
 - Confirmation of quantum electrodynamics
- > 1974: **D**oppel-**R**ing-**S**peicher
 - Heavy quarks and b-mesons
 - Since 1981: **H**amburg **s**ynchrotron radiation **l**aboratory (HASYLAB)
- > 1978: **P**ositron-**E**lektron-**T**andem-**R**ing-**A**nlage
 - Discovery of the gluon (1979)
 - Since 2009: used as synchrotron radiation source (PETRA III)
- > 1992: **H**adron-**E**lektron-**R**ing-**A**nlage
 - Supermicroscope for proton structure
- > 2005: **F**reie-**E**lektronen-**L**aser in **H**amburg
 - First FEL in the soft X-ray range
- > 2014: European **X**-Ray **F**ree-**E**lectron-**L**aser
 - Most intensive X-ray laser in the world

Development of accelerators.

➤ Energy frontier:

- from the first cyclotron (Lawrence, Berkeley 1931)
- to the Large Hadron Collider (2008)

Overall view of the LHC experiments.

➤ TESLA technology:

- Cavities
- Superconducting
 - ➔ need low temperatures
- Developed at DESY

Research with photons.

➤ Synchrotron radiation is light with special characteristics

- Very intensive
- Very strongly focused
- Very broad spectrum (wavelength can be chosen according to the needs of the experiment)

➤ Particle accelerators as synchrotron radiation sources

- Storage rings: DORIS III (HASYLAB) and PETRA III
- Free-electron lasers: FLASH and XFEL

Applications of synchrotron radiation.

➤ Structural analysis, e.g. of biomolecules

▪ From protein crystals ... via diffraction images ... to the 3D structure of ribosomes

➤ Structure of ribosomes: Nobel Prize in Chemistry 2009 (*Ada Yonath*)

- **Physics:** Material science, plasmas
- **Biology:** proteins,...
- **Chemistry, geology, medicine,...**
- **Arts:** hidden portrait in Van Gogh's painting *Grasgrond*

PETRA III & FEL: The capabilities of our facilities.

> PETRA III

- Incoherent light beam can only probe materials with a crystalline structure

- Crystals
- Freeze images of the nanocosm

> Free-electron laser

- Coherent light beam can also probe materials with an irregular structure

- Noncrystalline solids
- Biological substances
- Live observations of the nanocosm

The beginnings of particle physics.

- Around 400 BC – the void and ἄτομος (*Demokritos and Leukippos*)
- 19th century –
Periodic table of the elements
(*Mendelejew, Meyer*)
- 1897 – Discovery of the electron (*Thomson*)
- 1903 – Thomson's atomic model (Plum pudding model)

From atoms to elementary particles.

➤ 1909 – Rutherford experiment

- Scattering of alpha particles off a gold foil
- small fraction of the particles is deflected by a large angle or even reflected

➤ 1911 – Rutherford model

- The mass and the positive charge of the atoms is concentrated in a tiny, compact nucleus

➤ 1913 – Bohr model

- The electrons move on *quantised* circular orbits around the nucleus
- This model explains the atomic spectral lines

➤ Around 1950 until today – Discovery of new particles at particle accelerators → particle zoo

➤ Smallest constituents: elementary particles

How do we know all this?

➤ Investigation of the structure of known particles in scattering experiments

- High energy = High resolution

Low energy

➤ Creation of new, heavy particles according to $E=mc^2$

- Light, known particles with a large kinetic energy → new, heavier particles

The standard model of particle physics.

A closer look at particles and forces.

- All matter consists of point-like, indivisible elementary particles

- Protons and neutrons consist of quarks

- Quarks: up up down up down down
- Charge: $+\frac{2}{3} + \frac{2}{3} - \frac{1}{3} = +1$ $+\frac{2}{3} - \frac{1}{3} - \frac{1}{3} = 0$

- Forces are mediated by the exchange of particles

- Proton structure investigated at HERA

- Constituents: quarks and gluons
- Carry momentum fraction

Hadron-Elektron-Ring-Anlage (HERA).

- HERA model: built by many nations
- Electron-proton storage ring
 - Circumference: 6,3 km
 - Start of construction: 1984
 - Running period: 1992 – 2007
 - Data analysis: until 2014
 - Unique particle accelerator of this kind: e p
- Beam properties
 - Energy: protons 900 GeV, electrons 30 GeV
 - 210 bunches, $\simeq 10^{13}$ particles of each sort
 - Bunch crossing every 96 ns $0.3 \times 0.1 \times 8 \text{ mm}$
 - Electron beam dimension:
- 4 experiments
 - H1, ZEUS multi-purpose
 - Hermes: proton spin
 - **HERA B**: B-mesons, strong force

VISIT

Large Hadron Collider (LHC) at CERN.

➤ Proton-proton storage ring

- Circumference: 27 km
- strongest accelerator worldwide
- measurements: since 2009

➤ Objectives:

- Discover the Higgs particle
- Discover new particles beyond the standard model

➤ DESY involved: particle detectors CMS and ATLAS, accelerator development and theory

The Future: International Linear Collider (ILC).

> Electron-positron linear accelerator

- In planning stage, decision on construction and location by 2012
- Length: More than 30 km

> Objectives:

- Precision measurements of the new physics (hopefully) discovered at the LHC

> Acceleration technology developed at DESY (FLASH, European XFEL)

> DESY also involved in the development of the particle detectors

The interplay between theory and experiment.

Theoretical predictions

$$\begin{aligned} \mathcal{L}_{QWS} = & \sum_f (\bar{\Psi}_f (i\gamma^\mu \partial_\mu - m_f) \Psi_f - e Q_f \bar{\Psi}_f \gamma^\mu \Psi_f A_\mu) + \\ & + \frac{g}{\sqrt{2}} \sum_i (\bar{a}_L^i \gamma^\mu b_L^i W_\mu^+ + \bar{b}_L^i \gamma^\mu a_L^i W_\mu^-) + \frac{g}{2c_w} \sum_f \bar{\Psi}_f \gamma^\mu (I_f^3 - 2s_w^2 Q_f - I_{f,Y}) \Psi_f Z_\mu + \\ & - \frac{1}{4} |\partial_\mu A_\nu - \partial_\nu A_\mu - ie(W_\mu^- W_\nu^+ - W_\mu^+ W_\nu^-)|^2 - \frac{1}{2} |\partial_\mu W_\nu^+ - \partial_\nu W_\mu^+ + \\ & - ie(W_\mu^+ A_\nu - W_\nu^+ A_\mu) + ig' c_w (W_\mu^+ Z_\nu - W_\nu^+ Z_\mu)|^2 + \\ & - \frac{1}{4} |\partial_\mu Z_\nu - \partial_\nu Z_\mu + ig' c_w (W_\mu^- W_\nu^+ - W_\mu^+ W_\nu^-)|^2 + \\ & - \frac{1}{2} M_\eta^2 \eta^2 - \frac{g M_\eta^2}{8 M_W} \eta^3 - \frac{g'^2 M_\eta^2}{32 M_W} \eta^4 + |M_W W_\mu^+ + \frac{g}{2} \eta W_\mu^+|^2 + \\ & + \frac{1}{2} |\partial_\mu \eta + i M_Z Z_\mu + \frac{ig}{2c_w} \eta Z_\mu|^2 - \sum_f \frac{g}{2 M_W} \bar{\Psi}_f \Psi_f \eta \end{aligned}$$

- Test model
- Discover particles
- Establish new theories

- compare distributions of expected signal/ background with data
- new physics: not consistent with background
- 1 event not enough → need high statistics

Construction of machines

Event selection
